# THE SET OF INVARIANT STAR PRODUCTS ON NON-DEGENERATE TRIANGULAR LIE BIALGEBRAS OBTAINED IN THE ETINGOF-KAHZDAN QUANTIZATION THEORY 

CARLOS MORENO AND JOANA TELES

#### Abstract

Let $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{1}\right)$ be a non-degenerate triangular finite dimensional Lie bialgebra over $\mathbb{R}$. When a Lie associator $\Phi$ is fixed and for any formal solution $r_{\hbar}=r_{1}+\hbar r_{2}+\cdots \in(\mathfrak{a} \wedge \mathfrak{a})[\hbar \hbar]$ of Yang Baxter Equation (YBE), the theory of Etingof-Kazhdan allows us to obtain an Invariant Star Product (ISP), $\tilde{J}_{r_{\hbar}} \in$ $(\mathcal{U} \mathfrak{a} \otimes \mathcal{U} \mathfrak{a})[[\hbar]]$ on $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{1}\right)$. Every ISP $F$ determines an element $r_{\hbar}$ such that $F$ and $\tilde{J}_{r_{\hbar}}$ are equivalent. We define in this way a bijective mapping between the set of classes of ISPS modulo equivalence and the co-homology space $\hbar H^{2}(\mathfrak{a})[[\hbar]]$.

## 1. Introduction

1) Let $\left(\mathfrak{a},[,]_{\mathfrak{a}}\right)$ be the Lie algebra of a Lie group $\mathbf{G}$. Let $\left(\mathbf{G}, \beta_{1}\right)$ be a connected and simply connected Lie group endowed with an invariant symplectic structure $\beta_{1} \in \mathfrak{a}^{*} \wedge \mathfrak{a}^{*}$ and let $r_{1} \in \mathfrak{a} \wedge \mathfrak{a}$ be the corresponding solution to the Yang-Baxter-Equation (YBE) on $\left(\mathfrak{a},[,]_{\mathfrak{a}}\right)$. Let $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{1}\right)$ be the corresponding non-degenerate triangular Lie bialgebra. In [5] Drinfeld obtains all the Invariant Star Products (ISPS) on (G, $\beta_{1}$ ) (equivalently on $\left.\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{1}\right)\right)$ and a theorem showing that under equivalence $[10]$ the classifying set of all those ISPS is the Chevalley space $\beta_{1}+\hbar \cdot \sum H^{2}(\mathfrak{a}, \mathbb{R})[[\hbar]]$.
2) The aim of this paper is to obtain a classification theorem for all the ISPS on any non-degenerate triangular finite dimensional Lie bialgebra over $\mathbb{R}$ when they are obtained following the Etingof-Kazhdan [9] theory of quantization of Lie bialgebras. This theory is very different from the one considered in [5] but the classifying set for the set of ISPS is again $\beta_{1}+\hbar \cdot \sum H^{2}(\mathfrak{a}, \mathbb{R})[[\hbar]]$. In case we consider the Knizhnik-Zamolodchikov associator [7], over the field

$\mathbb{C}$, we have seen [22] that the ISP $\tilde{J}_{r_{1}}$ obtained here and the ISP $F\left(r_{1}\right)$ obtained by Drinfeld in [5] coincide modulo $\hbar^{3}$. In two particular cases of dimensions 2 and 4 for $\mathfrak{a}, \tilde{J}_{r_{1}}$ and $F\left(r_{1}\right)$ coincide modulo $\hbar^{4}$.
3) The adjoint representation of $\mathbf{G}$ induces a representation on the Chevalley complex $H^{*}(\mathfrak{a}, \mathbb{R})$ which is trivial. This classical theorem contains the idea for the proof of our classification theorem 6.11. We may compare this with the proofs in [19, 20] for the similar theorem in the quantization context of [5].

We present here the proofs of most of the results obtained.
4) Similar results as in the Abstract can be obtained on a non-degenerate triangular deformation Lie bialgebra, $[6,7],\left(\mathfrak{a}_{t} \equiv \mathfrak{a} \otimes_{\mathbb{K}} \mathbb{K}[[t]],[,]_{\mathfrak{a}_{t}}, \varepsilon_{\mathfrak{a}_{t}}=\right.$ $\left.d_{c}(t) r_{1}(t)\right)$ over $\mathbb{K}[[t]]$ of the non-degenerate triangular Lie bialgebra $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=\right.$ $d_{c} r_{1}$ ) over a field of characteristic zero $\mathbb{K}$. In this case we need to observe that a) $\mathbb{K}[[t]]$ is a local ring and a Principal Ideal Domain; b) the symmetric algebra of the $\mathbb{K}[[t]]$-module $\mathfrak{a}[t t]]$ is the algebra of divided powers $\Gamma\left(\mathfrak{a}_{t}\right)$, in the sense of $[3]$, over the $\mathbb{K}[[t]]$-module $\mathfrak{a}_{t}$; c) this symmetric algebra is isomorphic to the algebra of symmetric tensors $\operatorname{TS}(\mathfrak{a}[t t]])[4]$; d) the Hochschild cohomology $H^{*}(\mathcal{U a}[[t]])$ of the coalgebra $\mathcal{U a}[[t]]$ over $\mathbb{K}[[t]]$ is $\bigwedge(\mathfrak{a}[[t]])[3]$.

## 2. Some notations

1) Definitions and notations are those of $[5,7,15,16]$. A finite dimensional Lie bialgebra over $\mathbb{R}$ is denoted by the symbol $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}\right)$ where $\varepsilon_{\mathfrak{a}}$ is a 1-cocycle in the Chevalley cohomology on $\left(\mathfrak{a},[,]_{\mathfrak{a}}\right)$ with respect to the $a d_{\mathfrak{a}}$ - representation. When it is quasitriangular we write $\varepsilon_{\mathfrak{a}}=d_{c} r_{1}$, where $d_{c}$ is the coboundary in the above cohomology, $r_{1} \in \mathfrak{a} \otimes \mathfrak{a}$ is a solution to CYBE, $\left[r_{1}, r_{1}\right]=0$ on $\left(\mathfrak{a},[,]_{\mathfrak{a}}\right)$ and $r_{1}+\sigma\left(r_{1}\right)$ is $d_{\mathfrak{a}}$-invariant where $\sigma$ is the permutation (12). In case $r_{1}$ is skew-symmetric, it is a triangular Lie bialgebra and if moreover $\operatorname{det}\left(r_{1}\right) \neq 0$ we call it a non-degenerate triangular Lie bialgebra. If $\left(\mathfrak{a},[],, \varepsilon_{\mathfrak{a}}\right)$ is a Lie bialgebra we denote its quasitriangular double Lie bialgebra as the set $\left(\mathfrak{a} \oplus \mathfrak{a}^{*},[,]_{\mathfrak{a} \oplus \mathfrak{a}^{*}}, \varepsilon_{\mathfrak{a} \oplus \mathfrak{a}^{*}}=d_{c} r\right)$, where $r \in\left(\mathfrak{a} \oplus \mathfrak{a}^{*}\right)^{\otimes 2}$ is the invariant canonical element [2]. The element $\Omega=r+\sigma(r)$ is symmetric and $a d_{\mathfrak{a} \oplus \mathfrak{a}^{*}-\text { invariant. }}$
2) The symbol $\left(\mathfrak{a}[[\hbar]],[,]_{\mathfrak{a}[f f]}\right)$ will denote the Lie algebra over the ring $\mathbb{R}[[\hbar]]$ obtained from the Lie algebra $\left(\mathfrak{a},[,]_{\mathfrak{a}}\right)$ over $\mathbb{R}$ by the extension of scalars $\mathbb{R} \rightarrow \mathbb{R}[[\hbar]]$. $\left(\mathfrak{a} \oplus \mathfrak{a}^{*}\right)[[\hbar]]$ will denote the Lie algebra (bialgebra) over $\mathbb{R}[[\hbar]]$ which is the extension of the Lie bialgebra $\left(\mathfrak{a} \oplus \mathfrak{a}^{*},[,]_{\mathfrak{a} \oplus \mathfrak{a}^{*}}, \varepsilon_{\mathfrak{a} \oplus \mathfrak{a}^{*}}=d_{c} r\right)$ over $\mathbb{R}$. It is obvious that $\Omega=r+\sigma(r) \in\left(\mathfrak{a} \oplus \mathfrak{a}^{*}\right)^{\otimes 2}[[\hbar]]$ is $a d_{\mathfrak{a}[\hbar \hbar]]}$ invariant
and that these Lie-algebras over $\mathbb{R}[[\hbar]]$ are deformations algebras [7] of their corresponding Lie-algebras over $\mathbb{R}$.
3) Let $r_{t}=r_{1}+r_{2} t+r_{3} t^{2}+\cdots \in \mathfrak{a} \wedge \mathfrak{a}$ be an analytic function on a neighborhood of $0 \in \mathbb{R}$ defining a non-degenerate, $\operatorname{rank}\left(r_{1}\right)=\operatorname{dim} \mathfrak{a}$, solution of the CYBE $\left[r_{t}, r_{t}\right]=0$ on the Lie algebra $\left(\mathfrak{a},[,]_{\mathfrak{a}}\right)$ over $\mathbb{R}$. For each $t,\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{t}\right)$ is then a non-degenerate triangular Lie bialgebra on $M R$. The symbol $\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}[,]_{\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}}, \varepsilon_{\mathfrak{a} \oplus \mathfrak{a}_{r_{t}^{*}}}=d_{c} r\right)$ will denote the corresponding quasitriangular double Lie bialgebra on $\mathbb{R}$. Let $\mu_{r_{t}}: \wedge^{2} \mathfrak{a} \longrightarrow \wedge^{2} \mathfrak{a}^{*}$ be the linear isomorphism defined by the Poisson cocycle $r_{t}$. It induces an isomorphism between Poisson and Chevalley cohomology spaces [14]. Let $\left(\mathbf{G}, \beta_{t}\right)$ be the corresponding connected and simply-connected Lie group endowed with the invariant symplectic structure $\beta_{t}=\mu_{r_{t}}\left(r_{t}\right)$.
4) Let $r_{\hbar}=r_{1}+r_{2} \hbar+r_{3} \hbar^{2}+\cdots \in(\mathfrak{a} \wedge \mathfrak{a})[[\hbar]]$ be an invertible element solution of the CYBE $\left[r_{\hbar}, r_{\hbar}\right]=0$ on $\left(\mathfrak{a}[[\hbar]],[,]_{\mathfrak{a}[[\hbar]]}\right)$. The set $\left.\left(\mathfrak{a}[[\hbar]],[,]_{\mathfrak{a}[\hbar \hbar]]}, \varepsilon_{\mathfrak{a}[\hbar \hbar]]}=d_{c} r_{\hbar}\right)\right)$ will denote the corresponding triangular non-degenerate Lie bialgebra over $\mathbb{R}[[\hbar]]$ and its quasitriangular double Lie bialgebra will be denoted by $\left(\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}}^{*}\right)[[\hbar]],[,]_{\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{k}}^{*}\right)}, \varepsilon_{\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}}^{*}}=d_{c} r\right)$. In this situation, let $\mu_{r_{\hbar}}$ be the isomorphism similar to $\mu_{r_{t}}$ in 3).
5) We fix [9] a Lie associator $\Phi=\exp P\left(\hbar t_{12}, \hbar t_{23}\right)$ over $\mathbb{R}$.

## 3. Finite dimensional Etingof-Kazhdan quantization theory.

3.1. Quantization of the pair $\left(\mathfrak{a} \oplus \mathfrak{a}^{*} ; r\right)$. From theorem $A "$ in [7], we can deduce the following:
Theorem 3.1. [7] Let $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}\right),\left(\mathfrak{a} \oplus \mathfrak{a}^{*},[,]_{\mathfrak{a} \oplus \mathfrak{a}^{*}}, \varepsilon_{\mathfrak{a} \oplus \mathfrak{a}^{*}}=d_{c} r\right)$ and $\Omega=$ $r+\sigma(r)$ be as in section 2, 1). Let $\Phi=\exp P\left(\hbar \Omega_{12}, \hbar \Omega_{23}\right) \in \mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}^{*}\right)^{\otimes 3}[[\hbar]]$. Let $\left(\mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}^{*}\right)[[\hbar]], \cdot, \Delta_{0}, \epsilon_{0}, S_{0}\right)$ be the usual Hopf universal enveloping algebra. Write $\Phi=\sum_{i} X_{i} \otimes Y_{i} \otimes Z_{i}$ and $c=\sum_{i} X_{i} \cdot S_{0}\left(Y_{i}\right) \cdot Z_{i}$. Then the set

$$
\left(\mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}^{*}\right)[[\hbar]] ; \cdot ; 1 ; \Delta_{0} ; \epsilon_{0} ; \Phi ; S_{0} ; \alpha=c^{-1} ; \beta=1 ; R=e^{\frac{\hbar}{2} \Omega}\right)
$$

is a quasitriangular quasi-Hopf QUE-algebra whose classical limit [7] is $(\mathfrak{a} \oplus$ $\left.\mathfrak{a}^{*} ; \Omega\right)$.

The existence of the antipode follows from Theorem 1.6 in [7]. From Propositions 1.1 and 1.3 in [7] and from [11] it can be taken, [22], as the triple $\left(S_{0} ; \alpha=c^{-1} ; \beta=1\right)$.

To quantize the pair $\left(\mathfrak{a} \oplus \mathfrak{a}^{*} ; r\right)$ is to obtain a quasitriangular-Hopf $Q U E$ algebra over $\mathbb{R}[[\hbar]]$ such that its classical limit is that pair. A main theorem in this direction is the following (see also [8]):

Theorem 3.2. [9] Let $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}\right),\left(\mathfrak{a} \oplus \mathfrak{a}^{*},[,]_{\mathfrak{a} \oplus \mathfrak{a}^{*}}, \varepsilon_{\mathfrak{a} \oplus \mathfrak{a}^{*}}=d_{c} r\right)$ and $\Omega=$ $r+\sigma(r)$ be as in section 2, 1). Let $M_{ \pm}$be the $\mathfrak{a} \oplus \mathfrak{a}^{*}$-modules with one generator $1_{ \pm}$and defined as follows: $M_{+}=\mathcal{U} \mathfrak{a}^{*} \cdot 1_{+}, \mathcal{U} \mathfrak{a} \cdot 1_{+}=0$ and $M_{-}=\mathcal{U} \mathfrak{a} \cdot 1_{-}, \mathcal{U} \mathfrak{a}^{*} \cdot 1_{-}=0$. Then

1) The equalities $i_{ \pm}\left(1_{ \pm}\right)=1_{ \pm} \otimes 1_{ \pm}$define unique $\mathfrak{a} \oplus \mathfrak{a}^{*}$-module morphisms $i_{ \pm}: M_{ \pm} \longrightarrow M_{ \pm} \otimes M_{ \pm}$.
2) The equality $\phi(1)=1_{+} \otimes 1_{-}$defines a unique $\mathfrak{a} \oplus \mathfrak{a}^{*}$-module morphism $\phi: \mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}^{*}\right) \longrightarrow M_{+} \otimes M_{-} . \phi$ is an isomorphism.
3) There exists an element $J=\sum u_{i} \otimes v_{i} \in\left(\mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}^{*}\right)[[\hbar]]\right)^{\otimes 2}$ with $(i d \otimes$ $\left.\epsilon_{0}\right) J=1=\left(\epsilon_{0} \otimes i d\right) J$ such that when twisting $[6,7]$ the quasitriangular quasi-Hopf algebra of theorem 3.1 via $J^{-1}$ one obtains a quasitriangular Hopf QUE-algebra, $\left(\mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}^{*}\right)[[\hbar]] ; \cdot ; 1 ; \Delta ; \epsilon_{0} ; S ; R\right)$, which is a quantization of pair $\left(\mathfrak{a} \oplus \mathfrak{a}^{*} ; r\right)$. The element $J$ is
$J=\left(\phi^{-1} \otimes \phi^{-1}\right)\left(\Phi_{1,2,34}^{-1} \circ \Phi_{2,3,4} \circ \sigma_{23} \circ e^{\frac{\hbar}{2} \Omega_{23}} \circ \Phi_{2,3,4}^{-1} \circ \Phi_{1,2,34}\left(i_{+} \otimes i_{-}\right)(\phi(1))\right)$,
and when writing $Q=\sum S_{0}\left(u_{i}\right) \cdot v_{i}, u \in \mathfrak{a} \oplus \mathfrak{a}^{*}$ it is

$$
\Delta(u)=J^{-1} \cdot \Delta_{0}(u) \cdot J, \quad S(u)=Q^{-1} \cdot S_{0}(u) \cdot Q, \quad R=\sigma\left(J^{-1}\right) \cdot e^{\frac{\hbar}{2} \Omega} \cdot J
$$

and $\Phi$ verifies the following equalities
$\Phi \cdot\left(\Delta_{0} \otimes i d\right)(J) \cdot(J \otimes 1)=\left(1 \otimes \Delta_{0}\right)(J) \cdot(1 \otimes J), \quad R=1 \otimes 1+\hbar r \bmod \hbar^{2}$.
This quasitriangular Hopf QUE-algebra will be denoted by $A_{\left(\mathfrak{a} \oplus \mathfrak{a}^{*}\right)[[\hbar], \Omega, J-1}$.
3.2. Quantization of quasitriangular Lie bialgebras. 1) Let $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=\right.$ $d_{c} r_{1}$ ) be a quasitriangular Lie bialgebra. Consider the following linear isomorphisms $\theta^{+}, \theta^{-}: \mathfrak{a} \otimes \mathfrak{a} \longrightarrow \operatorname{Hom}\left(\mathfrak{a}^{*}, \mathfrak{a}\right)$ defined by

$$
\theta^{+}(x \otimes y)\left(x^{*}\right)=x \cdot x^{*}(y) \quad \theta^{-}(x \otimes y)\left(x^{*}\right)=x^{*}(x) \cdot y .
$$

Write $\mathfrak{a}_{ \pm}=\operatorname{Im} \theta^{ \pm}\left(r_{1}\right) \subseteq \mathfrak{a}$. The notion of the rank of $r_{1}$ allows us to assert:
a) the subspaces $\operatorname{Im} \theta^{ \pm}\left(r_{1}\right)=\mathfrak{a}_{ \pm}$associated with $r_{1} \in \mathfrak{a} \otimes \mathfrak{a}$ are canonically isomorphic to $\left(\operatorname{Im} \theta^{\mp}\left(r_{1}\right)\right)^{*} \equiv \mathfrak{a}_{\mp}^{*}$.
b) $\quad r_{1} \in \mathfrak{a}_{+} \otimes \mathfrak{a}_{-}$and $r_{1}=\sum_{i} a_{i} \otimes b_{i}$, where $a_{i} \in \mathfrak{a}_{+}$and $b_{i} \in \mathfrak{a}_{-}, \forall i=$ $\left\{1,2, \cdots, \operatorname{rank}\left(r_{1}\right)\right\}$.
c) the mapping $\chi_{r_{1}}: \mathfrak{a}_{+}^{*} \rightarrow \mathfrak{a}_{-}$defined by $\chi_{r_{1}}\left(x^{*}\right)=\sum_{i} x^{*}\left(a_{i}\right) \cdot b_{i}$ is an isomorphism.
As $r_{1}$ is a solution of the CYBE, $\mathfrak{a}_{+}$and $\mathfrak{a}_{-}$are Lie subalgebras of $\mathfrak{a}$, a result from [12].

Using the isomorphism $\chi_{r_{1}}$ it is possible to define a Lie algebra structure on $\mathfrak{a}_{+}^{*}$ by $[,]_{\mathfrak{a}_{+}}^{*}=\chi_{r_{1}}^{-1} \circ[,]_{\mathfrak{a}_{-}} \circ\left(\chi_{r_{1}} \otimes \chi_{r_{1}}\right)$. Then we have

Theorem 3.3. The Lie algebra structures $[,]_{\mathfrak{a}_{+}^{*}}$ on $\mathfrak{a}_{+}^{*}$ and $[,]_{\mathfrak{a}_{+}}$on $\mathfrak{a}_{+}$are compatible in the sense of Drinfeld (see $[15,16]$ ). The mapping $\varepsilon_{\mathfrak{a}_{+}}=\phi^{t}$ : $\mathfrak{a}_{+} \longrightarrow \mathfrak{a}_{+} \otimes \mathfrak{a}_{+}$where $\phi\left(\xi_{1} \otimes \xi_{2}\right)=\left[\xi_{1} ; \xi_{2}\right]_{\mathfrak{a}_{+}^{*}}$ is then a 1-cocycle on $\left(\mathfrak{a}_{+},[,]_{\mathfrak{a}_{+}}\right)$. The set $\left(\mathfrak{a}_{+},[,]_{\mathfrak{a}_{+}}, \varepsilon_{\mathfrak{a}_{+}}=\phi^{t}\right)$ is a Lie bialgebra whose quasitriangular double Lie bialgebra is $\left(\mathfrak{a}_{+} \oplus \mathfrak{a}_{+}^{*},[,]_{\mathfrak{a}_{+} \oplus \mathfrak{a}_{+}^{*}}, \varepsilon_{\mathfrak{a}_{+} \oplus \mathfrak{a}_{+}^{*}}=d_{c} r_{+}\right)$, where $r_{+}$is the invariant canonical element.

From [12, 9] it follows
Proposition 3.4. The mapping $\tilde{\pi}: \mathfrak{a}_{+} \oplus \mathfrak{a}_{+}^{*} \longrightarrow \mathfrak{a}$, defined as $\tilde{\pi}(x ; \xi)=$ $x+\chi_{r_{1}}(\xi)$ is a Lie-bialgebra-morphism. That is, a Lie-algebra morphism verifying $d_{c} r_{1} \circ \tilde{\pi}=(\tilde{\pi} \otimes \tilde{\pi}) \circ d_{c} r_{+}$. Moreover $(\tilde{\pi} \otimes \tilde{\pi}) r_{+}=r_{1}$. The symbol $\tilde{\pi}$ will also denote the unique algebra morphism $\tilde{\pi}: \mathcal{U}\left(\mathfrak{a}_{+} \oplus \mathfrak{a}_{+}^{*}\right) \longrightarrow \mathcal{U}(\mathfrak{a})$ defined by the Lie algebra morphism $\tilde{\pi}$.
2) From theorems 3.1, 3.3 and proposition 3.4 it is possible to obtain a quantization of the pair $\left(\mathfrak{a}, r_{1}+\sigma\left(r_{1}\right)\right)$. With the obvious notations we have

Theorem 3.5. Let $\left(\mathfrak{a}_{+} \oplus \mathfrak{a}_{+}^{*},[,]_{\mathfrak{a}_{+} \oplus \mathfrak{a}_{+}^{*}}, \varepsilon_{\mathfrak{a}_{+} \oplus \mathfrak{a}_{+}^{*}}=d_{c} r_{+}\right)$be the quasitriangular Lie bialgebra in theorem 3.3. Let $\left(\mathcal{U a}[[\hbar]], \cdot, 1, \Delta_{\mathfrak{a}}, \epsilon_{\mathfrak{a}}, S_{\mathfrak{a}}\right)$ be the usual Hopf universal enveloping algebra. Let

$$
\left(\mathcal{U}\left(\mathfrak{a}_{+} \oplus \mathfrak{a}_{+}^{*}\right)[[\hbar]], \cdot, 1, \Delta_{0}^{+}, \epsilon_{0}^{+}, \Phi^{+}, S_{0}^{+}, \alpha^{+}=\left(c^{+}\right)^{-1}, \beta^{+}=1, R_{0}^{+}=e^{\frac{\hbar}{2} \Omega_{+}}\right),
$$

be the quasitriangular quasi-Hopf algebra in theorem 3.1 whose classical limit is the pair $\left(\mathfrak{a}_{+} \oplus \mathfrak{a}_{+}^{*}, \Omega_{+}\right)$. Then we have the equalities : $(\tilde{\pi} \otimes \tilde{\pi}) \circ \Delta_{0}^{+}=$ $\Delta_{\mathfrak{a}} \circ \tilde{\pi} ; \tilde{\pi} \circ S_{0}^{+}=S_{\mathfrak{a}} \circ \tilde{\pi}$ and putting $\tilde{\Phi}^{+}=(\tilde{\pi} \otimes \tilde{\pi}) \Phi^{+}, R_{\mathfrak{a}}=(\tilde{\pi} \otimes \tilde{\pi}) R_{0}^{+}$, the set $\left(\mathcal{U a}[[\hbar]], \cdot, 1, \Delta_{\mathfrak{a}}, \epsilon_{\mathfrak{a}}, \tilde{\Phi}^{+}, S_{\mathfrak{a}}, \tilde{\alpha}=\left(\tilde{\pi}\left(c^{+}\right)\right)^{-1}, \tilde{\beta}=1, R_{\mathfrak{a}}\right)$ is a quasitriangular quasi-Hopf QUE-algebra whose classical limit is the pair $\left(\mathfrak{a}, r_{1}+\sigma\left(r_{1}\right)\right)$.

The above results allow us to obtain a quantization of the pair $\left(\mathfrak{a}, r_{1}\right)$. With the obvious notations the result can be stated as follows [9] (see also [22]):

Theorem 3.6. Let $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{1}\right)$ be a quasitriangular Lie bialgebra. Let $\left(\mathfrak{a}_{+} \oplus \mathfrak{a}_{+}^{*},[,]_{\mathfrak{a}_{+} \oplus \mathfrak{a}_{+}^{*}}, \varepsilon_{\mathfrak{a}_{+} \oplus \mathfrak{a}_{+}^{*}}=d_{c} r_{+}\right)$be the quasitriangular Lie bialgebra in theorem 3.3. Let $\left(\mathcal{U}\left(\mathfrak{a}_{+} \oplus \mathfrak{a}_{+}^{*}\right)[[\hbar]], \cdot, 1 ; \varepsilon_{0}^{+} ; \Delta^{+}, S^{+}, R^{+}\right)$be the quasitriangular Hopf QUE algebra obtained as in theorem 3.2, 3). Write $\tilde{J}_{r_{1}}^{+}=(\tilde{\pi} \otimes \tilde{\pi}) J^{+}$. We have the equality

$$
\tilde{\Phi}_{1,2,3}^{+} \cdot\left(\Delta_{\mathfrak{a}} \otimes i d\right) \tilde{J}_{r_{1}}^{+} \cdot\left(\tilde{J}_{r_{1}}^{+} \otimes 1\right)=\left(i d \otimes \Delta_{\mathfrak{a}}\right) \tilde{J}_{r_{1}}^{+} \cdot\left(1 \otimes \tilde{J}_{r_{1}}^{+}\right) .
$$

Write again $\tilde{J}_{r_{1}}=\sum p_{i} \otimes q_{i} ; a \in \mathcal{U} \mathfrak{a}, \quad \tilde{Q}=\sum S_{\mathfrak{a}}\left(p_{i}\right) \cdot q_{i}$. The set $(\mathcal{U} \mathfrak{a}[[\hbar]], \cdot, 1$, $\left.\tilde{\Delta}, \tilde{\epsilon}=\epsilon_{\mathfrak{d}}, \tilde{S}, \tilde{R}\right)$ where

$$
\tilde{\Delta}(a)=\left(\tilde{J}_{r_{1}}^{+}\right)^{-1} \cdot \Delta_{\mathfrak{a}}(a) \cdot \tilde{J}_{r_{1}}^{+} ; \epsilon_{\mathfrak{a}} ; \tilde{R}=(\tilde{\pi} \otimes \tilde{\pi}) R^{+} ; \tilde{S}(a)=\tilde{Q}^{-1} \cdot S_{\mathfrak{a}}(a) \cdot \tilde{Q}
$$

is a quasitriangular Hopf QUE-algebra which is a quantization of the pair $\left(\mathfrak{a} ; r_{1}\right)$, and has been obtained by a twist, [6], via the element $\left(\tilde{J}_{r_{1}}^{+}\right)^{-1}$ from the quasitriangular quasi-Hopf algebra in theorem 3.5.

## 4. Quantization of non-degenerate triangular Lie bialgebras

1) In case of a non-degenerate triangular Lie bialgebra $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{1}\right)$, we have $\operatorname{rank}\left(r_{1}\right)=\operatorname{dim} \mathfrak{a}, r_{1} \in \wedge^{2}(\mathfrak{a})$. Also $\mathfrak{a}_{+}=\mathfrak{a}_{-}=\mathfrak{a}$ as Lie algebras, $(\tilde{\pi} \otimes \tilde{\pi}) \Omega_{+}=(\tilde{\pi} \otimes \tilde{\pi})\left(r_{1}+\sigma\left(r_{1}\right)\right)=0$ and we get the equality $\varepsilon_{\mathfrak{a}_{+}}=\varepsilon_{\mathfrak{a}}=d_{c} r_{1}$.

Definition 4.1. $[1,5,19,17]$ ) An ISP on a non-degenerate triangular Lie bialgebra ( $\mathfrak{a}$, $[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{1}$ ) is any element $F=\sum_{0}^{\infty} F_{k} \cdot \hbar^{k} \in \mathcal{U} \mathfrak{a}^{\otimes 2}[[\hbar]]$ verifying the following equalities:

1) $\left(\epsilon_{\mathfrak{a}} \otimes i d\right) F=\left(i d \otimes \epsilon_{\mathfrak{a}}\right) F=1 \otimes 1$;
2) $F-\sigma(F)=r_{1} \hbar \bmod \hbar^{2}$;
3) $\left(\Delta_{\mathfrak{a}} \otimes 1\right) F \cdot(F \otimes 1)=\left(1 \otimes \Delta_{\mathfrak{a}}\right) F \cdot(1 \otimes F)$.

Theorem 3.6 allows us to obtain an ISP on any non-degenerate triangular Lie bialgebra. In fact it allows us to obtain, modulo equivalence, all of them, as we will see in section 6 .

Theorem 4.2. Suppose in Theorem 3.6 that $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{1}\right)$ is a nondegenerate triangular Lie bialgebra. Then

$$
\tilde{\Phi}=(\tilde{\pi} \otimes \tilde{\pi} \otimes \tilde{\pi}) \Phi=1 \otimes 1 \otimes 1 .
$$

1) $\left(\epsilon_{\mathfrak{a}} \otimes i d\right) \tilde{J}_{r_{1}}=\left(i d \otimes \epsilon_{\mathfrak{a}}\right) \tilde{J}_{r_{1}}=1 \otimes 1$.
2) $\tilde{J}_{r_{1}}=1 \otimes 1+\frac{1}{2} r_{1} \hbar+\cdots$
3) $\left(\Delta_{\mathfrak{a}} \otimes 1\right) \tilde{J}_{r_{1}} \cdot\left(\tilde{J}_{r_{1}} \otimes 1\right)=\left(1 \otimes \Delta_{\mathfrak{a}}\right) \tilde{J}_{r_{1}} \cdot\left(1 \otimes \tilde{J}_{r_{1}}\right)$.
4) $\tilde{R}=(\tilde{\pi} \otimes \tilde{\pi}) R=\sigma\left(\tilde{J}_{r_{1}}^{-1}\right) \cdot(1 \otimes 1) \cdot \tilde{J}_{r_{1}}=1 \otimes 1+r_{1} \hbar+\cdots$

In particular $\tilde{J}_{r_{1}}$ is an ISP on $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{1}\right.$.)
The triangular Hopf QUE algebra $\left(\mathcal{U a}[[\hbar]], \cdot, 1, \tilde{\Delta}, \tilde{\epsilon}=\epsilon_{\mathfrak{a}}, \tilde{S}, \tilde{R}\right)$, denoted by $A_{\mathfrak{a}[\hbar \hbar], \tilde{J}_{1}^{-1}}$, which is obtained by a twist via $\tilde{J}_{r_{1}}^{-1}$ from the trivial triangular Hopf QUE algebra $\left(\mathcal{U a}[[\hbar]], \cdot, 1, \Delta_{\mathfrak{a}}, \epsilon_{\mathfrak{a}}, S_{\mathfrak{a}}, R_{\mathfrak{a}}=1 \otimes 1\right)$ is a quantization of the pair $\left(\mathfrak{a} ; r_{1}\right)$.
2) The above proposition shows how to obtain an $\operatorname{ISP}$ on $\left(\mathbf{G}, \beta_{t}\right)$ as in 3) Section 2. The following proposition will show that if we put $\hbar$ in place of $t$ in this star product we have again an ISP but this time on the Lie group $\left(\mathbf{G}, \beta_{1}\right)$. In this way we don't get all the ISPS on $\left(\mathbf{G}, \beta_{1}\right)$ but if we now replace the above $r_{\hbar}$ coming from $r_{t}$ by any element in $(\mathfrak{a} \wedge \mathfrak{a})[[\hbar]]$ of the form $r_{\hbar}=r_{1}+\cdots \in(\mathfrak{a} \wedge \mathfrak{a})[[\hbar]]$ we obtain, up to equivalence, all the (ISP's) on (G, $\beta_{1}$ ).
Proposition 4.3. Let $\left(\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}}^{*}\right)[[\hbar]],[,]_{\mathfrak{a} \oplus \mathfrak{a}_{r_{h}}^{*}}, \varepsilon_{\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}}^{*}}=d_{c} r\right)$ and $r_{\hbar} \in(\mathfrak{a} \wedge$ $\mathfrak{a})[[\hbar]]$ be as in Section 2, 4). For any $N \in \mathbb{N}$ there exists an analytic function in a neighborhood of $t=0, r_{t}^{N}=r_{1}+r_{2} t+r_{3} t^{2}+\cdots \in \mathfrak{a} \wedge \mathfrak{a}$ and a solution of YBE on $\left(\mathfrak{a},[,]_{\mathfrak{a}}\right)$, such that when replacing $t$ by $\hbar$ in the above series expansion $r_{t}^{N}$ and $r_{\hbar}$ coincide up to order $N$.

## Proof:

In the Poisson cohomology on the Lie algebra $\left(\mathfrak{a}[[\hbar]],[,]_{\mathfrak{a}[\hbar]]}\right)$ the element $\beta_{\hbar}=\beta_{1}+\beta_{2} \hbar+\beta_{3} \hbar^{2}+\cdots \in\left(\mathfrak{a}^{*} \wedge \mathfrak{a}^{*}\right)[[\hbar]]$ defined as $\beta_{\hbar}=\mu_{r_{\hbar}}\left(r_{\hbar}\right)$ is a Chevalley 2 -cocycle. The polynomial $\beta_{t}^{N}=\beta_{1}+\beta_{2} t+\beta_{3} t^{2}+\cdots+\beta_{N-1} t^{N} \in \mathfrak{a}^{*} \wedge \mathfrak{a}^{*}$ is also a Chevalley 2-cocycle on $\left(\mathfrak{a},[,]_{\mathfrak{a}}\right)$. The corresponding element $r_{t}^{N}=r_{1}+r_{2} t+\cdots$ satisfies YBE on $\left(\mathfrak{a},[,]_{\mathfrak{a}}\right)$ and when we replace $\hbar$ in place of $t$ it coincides with $r_{\hbar}$ up to term $N$.
3) From theorem 3.1 we may deduce, in the obvious notations,

Theorem 4.4. Let $\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*},[,]_{\mathfrak{a} \oplus \mathfrak{a}_{r_{t}^{*}}^{*}}, \varepsilon_{\mathfrak{a} \oplus \mathfrak{a}_{r_{t}^{*}}}=d_{c} r\right)$ over $\mathbb{R}$ be as in Section 2, 3). The set

$$
\left(\mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}\right)[[\hbar]],{ }_{t}, 1, \Delta_{0}^{t}, \epsilon_{0}^{t}, \Phi_{r_{t}}, S_{0}^{t}, \alpha^{t}=c_{t}^{-1}, \beta^{t}=1, R_{0}^{t}=e^{\frac{\hbar}{2} \Omega_{t}}\right)
$$

where $c_{t}=\sum_{i} X_{i} \cdot{ }_{\cdot} S_{0}^{t}\left(Y_{i}\right) \cdot{ }_{t} Z_{i}$, with $\Phi_{r_{t}}=\sum_{i} X_{i}^{t} \otimes Y_{i}^{t} \otimes Z_{i}^{t}$, is a quasitriangular quasi-Hopf QUE algebra over $\mathbb{R}[[\hbar]]$ with the pair $\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}, \Omega_{t}\right)$ as its classical limit.

From theorem 4.4 and proposition 4.3 we can prove
Theorem 4.5. Let $\left.\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}}^{*}[\hbar \hbar]\right],[,]_{\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}^{*}}^{*}}, \varepsilon_{\mathfrak{a} \oplus \mathfrak{a}_{r_{h}}^{*}}=d_{c} r\right)$ over $\mathbb{R}[[\hbar]]$ be as in Section 2, 4). The set

$$
\left(\mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}}^{*}\right)[[\hbar]], \cdot{ }_{\hbar}, 1, \Delta_{0}^{\hbar}, \epsilon_{0}, \Phi_{r_{\hbar}}, S_{0}^{\hbar}, \alpha^{\hbar}=c_{\hbar}^{-1}, \beta^{\hbar}=1, R_{0}^{\hbar}=e^{\frac{\hbar}{2} \Omega_{\hbar}}\right)
$$

is then a quasitriangular quasi-Hopf QUE algebra over $\mathbb{R}[[\hbar]]$, where $c_{\hbar}=$ $\sum_{i} X_{i}^{\hbar} \cdot \hbar S_{0}^{\hbar}\left(Y_{i}^{\hbar}\right) \cdot \hbar Z_{i}^{\hbar}$ with $\Phi_{r_{\hbar}}=\sum_{i} X_{i}^{\hbar} \otimes Y_{i}^{\hbar} \otimes Z_{i}^{\hbar}$ and $S_{0}^{\hbar}$ is the antipode of $\left.\mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}}^{*}[\hbar \hbar]\right]\right)$.

## Proof:

This theorem follows from Theorem $A$ " in [7]. In view of the next sections we want to obtain it from theorem 4.4 by quantizing first the Lie groups $\left(\mathbf{G}, \beta_{t}\right)$. All the elements in the above set in the theorem are well defined with the corresponding meanings on $\mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}}^{*}\right)[[\hbar]]$ and can be seen as those obtained from the corresponding ones in theorem 4.4 if we use the full-meaning trick of putting $\hbar$ in place of $t$. To prove that this set defines a quasitriangular quasi-Hopf QUE algebra over $\mathbb{R}[[\hbar]]$ we need to prove the equalities which define this structure $[6,7]$. These equalities are satisfied in the case of $r_{t}$. This means that for each one of them and when an ordered basis is used in $\mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}\right)$ an infinite set of polynomials in the components of $r_{t}$ are zero. But the set of these components is characterized just by the algebraic equations characterizing a solution of YBE. As a consequence we can see that the corresponding equalities are also satisfied if we replace everywhere $t$ by $\hbar$, and of course also in the products of elements in the above basis, that is $r_{t}$ by the corresponding solution $r_{\hbar}$ of YBE on $\left(\mathfrak{a}[[\hbar]],[,]_{\mathfrak{a}[\hbar \hbar]}\right)$. Then applying Proposition 4.3 we get the theorem.
4) Theorem 3.2 allows us to write

Theorem 4.6. Let $\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*},[,]_{\mathfrak{a} \oplus \mathfrak{a}_{r_{t}^{*}}^{*}}, \varepsilon_{\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}}=d_{c} r\right)$ over $\mathbb{R}$ be as in Section 2, 3). Write $J_{r_{t}}=\sum_{i} u_{i} \otimes v_{i} \in \mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}\right)^{\otimes^{2}}[[\hbar]]$ where

$$
\begin{aligned}
J_{r_{t}}=\left(\phi_{t}^{-1} \otimes \phi_{t}^{-1}\right) & \left(\left(\Phi_{r_{t}}^{-1}\right)_{1,2,34} \circ\left(\Phi_{r_{t}}\right)_{2,3,4} \circ \sigma_{23} \circ e^{\frac{\hbar}{2}\left(\Omega_{t}\right)_{23}} \circ\left(\Phi_{r_{t}}^{-1}\right)_{2,3,4} \circ\right. \\
& \left.\circ\left(\Phi_{r_{t}}\right)_{1,2,34} \circ \circ\left(i_{+} \otimes i_{-}\right) \circ \phi_{t}(1)\right)
\end{aligned}
$$

is the corresponding element to the one introduced in theorem 3.2, part 3). In the present case we have written $\phi_{t}: \mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}\right) \longrightarrow M_{+}^{r_{t}} \otimes M_{-}^{r_{t}}$ for the morphism $\phi$. The element $J_{r_{t}}$ satisfies the equalities $\left(i d \otimes \epsilon_{0}^{t}\right) J_{r_{t}}=1=$ $\left(\epsilon_{0}^{t} \otimes i d\right) J_{r_{t}}$ and when twisting the quasitriangular quasi-Hopf QUE-algebra in theorem 4.4 via $J_{r_{t}}^{-1}$ one obtains a quasitriangular Hopf QUE-algebra $\left(\mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}\right)[[\hbar]],{ }^{\prime}, 1, \Delta_{t}, \epsilon_{t} \equiv \epsilon_{0}^{t}, S_{t}, R_{t}\right)$ over $\mathbb{R}[[\hbar]]$ whose classical limit is the pair $\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*} ; r_{t}\right)$ and which will be denoted by $A_{\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}[t h], \Omega_{t}, J_{r_{t}}^{-1}}$. If we write $Q_{t}=\sum_{i} S_{0}^{t}\left(u_{i}\right) \cdot{ }_{t} v_{i}$ the above defining elements are
$\Delta_{t}(u)=J_{r_{t}}^{-1} \cdot{ }_{t} \Delta_{0}^{t}(u) \cdot{ }_{t} J_{r_{t}} ; S_{t}(u)=Q_{t}^{-1} \cdot{ }_{t} S_{0}^{t}(u) \cdot{ }_{t} Q_{t} ; R_{t}=\sigma\left(J_{r_{t}}\right)^{-1} \cdot{ }_{t} e^{\frac{\hbar}{2} \Omega_{t}} \cdot{ }_{t} J_{r_{t}}$, and $\Phi_{r_{t}}$ satisfies the following equalities
$\Phi_{r_{t}} \cdot t\left(\Delta_{0}^{t} \otimes i d\right)\left(J_{r_{t}}\right) \cdot t\left(J_{r_{t}} \otimes 1\right)=\left(1 \otimes \Delta_{0}^{t}\right)\left(J_{r_{t}}\right) \cdot t\left(1 \otimes J_{r_{t}}\right) ; R_{t}=1 \otimes 1+\hbar r_{t} \quad \bmod \hbar^{2}$.
The next theorem can be proved from theorem 4.6 in a similar way as theorem 4.5. See also Lemma 4.8.

Theorem 4.7. The set $\left(\mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}}^{*}\right)[[\hbar]],{ }_{\hbar}, 1, \Delta_{\hbar}, \epsilon_{0}, S_{\hbar}, R_{\hbar}\right)$ is a quasitriangular Hopf QUE algebra over $\mathbb{R}[[\hbar]]$. Its defining elements are the following

$$
\begin{gathered}
\Delta_{\hbar}(a)=J_{r_{\hbar}}^{-1} \cdot \hbar \Delta_{0}^{\hbar}(a) \cdot \hbar J_{r_{\hbar}}, \quad S_{\hbar}(a)=Q_{\hbar}^{-1} \cdot \hbar S_{0}^{\hbar}(a) \cdot \hbar Q_{\hbar}, \\
R_{\hbar}=\sigma\left(J_{r_{\hbar}}^{-1}\right) \cdot{ }_{\hbar} e^{\frac{\hbar}{2} \Omega} \cdot \hbar J_{r_{\hbar}},
\end{gathered}
$$

where $Q_{\hbar}=\sum_{i} S_{0}^{\hbar}\left(p_{i}\right){ }^{\hbar} q_{i}, J_{r_{\hbar}}=\sum_{i} p_{i} \otimes q_{i}, a \in \mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}}^{*}\right)[[\hbar]]$ and $\Phi_{r_{\hbar}}$ satisfies the following equalities

$$
\Phi_{r_{\hbar} \cdot \hbar}\left(\Delta_{0}^{\hbar} \otimes i d\right)\left(J_{r_{\hbar}}\right) \cdot \hbar\left(J_{r_{\hbar}} \otimes 1\right)=\left(1 \otimes \Delta_{0}^{\hbar}\right)\left(J_{r_{\hbar}}\right) \cdot \hbar\left(1 \otimes J_{r_{\hbar}}\right) ; R_{\hbar}=1 \otimes 1+\hbar r_{\hbar} \bmod \hbar^{2} .
$$

This quasitriangular Hopf QUE algebra over $\mathbb{R}[[\hbar]]$ is therefore obtained from the quasitriangular quasi-Hopf algebra in theorem 4.5 via the element $J_{r_{\hbar}}^{-1} \in \mathcal{U}\left(\widehat{\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}}^{*}}\right) \hat{\otimes} \mathcal{U}\left(\widehat{\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}}^{*}}\right)$. Its classical limit is the quasitriangular Lie bialgebra $\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{1}}^{*},[,]_{\mathfrak{a} \oplus \mathfrak{a}_{r_{1}}^{*}}, \varepsilon=d_{c} r\right)$. We denote it by $A_{\mathfrak{a} \oplus \mathfrak{a}_{r_{h}}^{*}, \Omega, J_{r_{h}}^{-1}}$.
5) The following two lemmas will be needed.

Choose an ordered basis $\left\{e_{a}\right\}$ in $\mathfrak{a}$, and its dual basis $\left\{e^{a}\right\}$ in $\mathfrak{a}^{*}$. Then we can construct ordered bases in $\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}, \mathcal{U} \mathfrak{a}, \mathcal{U} \mathfrak{a}^{*}, \mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}\right)^{\otimes 2}$. We can prove Lemma 4.8. [22] Let $r_{t}=r_{1}+r_{2} t+r_{3} t^{2}+\cdots \in \mathfrak{a} \wedge \mathfrak{a}$ be as in Section 2, 3). The element $J_{r_{t}} \in \mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}\right)^{\otimes 2}[[\hbar]]$ in Theorem 4.6 can be written as

$$
J_{r_{t}}=1 \otimes 1+\frac{1}{2} r \hbar+\sum_{k \geq 2}\left(r_{t}^{i_{1} j_{1}} \ldots r_{t}^{i_{l(k)} j_{l(k)}} Q_{i_{1}, \ldots, i_{l(k)}, j_{1}, \ldots, j_{l(k)}, k}\right) \hbar^{k}
$$

where $Q_{i_{1}, \ldots, i_{l(k)}, j_{1}, \ldots, j_{l(k)}, k} \in \mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}\right)^{\otimes 2}$ is a (finite) linear combination of tensor products of elements in the above ordered basis. $r_{t}$ is manifested in every element of the ordered basis through the product in $\mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}\right)$ but it does not appear in the coefficients defining $Q_{i_{1}, \ldots, i_{l(k)}, j_{1}, \ldots, j_{l(k)}, k}$.

## Proof:

From the expression of $J$ on theorem 3.2 and because $\Phi=1 \otimes 1 \otimes 1+O\left(\hbar^{2}\right)$ we have

$$
\begin{aligned}
J_{r_{t}}= & \left(\phi_{t}^{-1} \otimes \phi_{t}^{-1}\right)\left(\left(1+\frac{\hbar}{2} \Omega_{23}\right)\left(1_{+} \otimes 1_{-} \otimes 1_{+} \otimes 1_{-}\right)\right) \bmod \hbar^{2} \\
= & \left(\left(\phi_{t}^{-1} \otimes \phi_{t}^{-1}\right)\left(1_{+} \otimes 1_{-} \otimes 1_{+} \otimes 1_{-}\right)+\right. \\
& \left.+\frac{1}{2}\left(\phi_{t}^{-1} \otimes \phi_{t}^{-1}\right)\left(1_{+} \otimes r_{12}\left(1_{-} \otimes 1_{+}\right) \otimes 1_{-}\right) \hbar\right) \bmod \hbar^{2} \\
= & \left(1 \otimes 1+\frac{1}{2} r \hbar\right) \bmod \hbar^{2} .
\end{aligned}
$$

In the expression for $J_{r_{t}}$ the coefficient of $\hbar^{k}$, for $k \geq 2$, is an element in $\mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}\right) \otimes \mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}\right)$ which depends on $r_{t}$ (by the brackets on $\Phi_{r_{t}}$ and by the products on $\mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}\right)$ ), so is of the form

$$
r_{t}^{i_{1} j_{1}} \ldots r_{t}^{i_{l(k)} j_{l(k)}} Q_{i_{1}, \ldots, i_{l(k)}, j_{1}, \ldots, j_{l(k)}, k},
$$

where $Q_{i_{1}, \ldots, i_{l(k)}, j_{1}, \ldots, j_{l(k)}, k} \in \mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}\right) \otimes \mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}\right)$ only depends on $r_{t}$ through the products on the enveloping algebra $\mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}\right)$ in the ordered basis.

As the product in $\mathcal{U a}$ is independent of $r_{t}$, applying $\tilde{\pi}_{t} \otimes \tilde{\pi}_{t}$ to $J_{r_{t}}$ and then putting $t=\hbar$, we can also prove

Lemma 4.9. [22] Let $r_{t}=r_{1}+r_{2} t+r_{3} t^{2}+\cdots \in \wedge^{2}(\mathfrak{a})$ be as in Section 2, 3). Write $r_{l}=r_{l}^{a b} e_{a} \otimes e_{b}, r_{l}^{a b}+r_{l}^{b a}=0, l=1,2,3, \cdots$. Let $\tilde{\pi}_{t}$ be the Lie
bialgebra morphism defined in proposition 3.4 and define $\tilde{J}_{r_{t}}=\left(\tilde{\pi}_{t} \otimes \tilde{\pi}_{t}\right) J_{r_{t}}$, $\tilde{J}_{r_{\hbar}}=\left.\left(\tilde{J}_{r_{t}}\right)\right|_{t \rightarrow \hbar} \in(\mathcal{U a})^{\otimes 2}[[\hbar]]$. Write it as a formal power series in $\hbar$. The element $\tilde{J}_{r_{\hbar}}$ can be written as

$$
\begin{gathered}
\tilde{J}_{r_{\hbar}}=1 \otimes 1+\frac{1}{2} r_{1} \hbar+\sum_{R=2}^{\infty}\left(\frac{1}{2} r_{R}+\sum_{i_{2}, j_{2}, \ldots i_{R}, j_{R}}\left(\sum_{A_{i_{2}, j_{2}}(R), \ldots, A_{i_{R} j_{R}}(R)}\right.\right. \\
\left.\left.\left(r_{1}^{i_{2} j_{2}}\right)^{A_{i_{2} j_{2}}(R)} \ldots\left(r_{R-1}^{i_{R} j_{R}}\right)^{A_{i_{R} j_{R}}(R)} H_{i_{2}, \ldots, i_{R}, j_{2}, \ldots, j_{R}, A_{i_{2} j_{2}}(R), \ldots, A_{i_{R} j_{R}}(R), R}\right)\right) \hbar^{R},
\end{gathered}
$$

where $H_{i_{2}, \ldots, i_{R}, j_{2}, \ldots, j_{R}, A_{i_{2} j_{2}}(R), \ldots, A_{i_{R} j_{R}}(R), R} \in(\mathcal{U} \mathfrak{a})^{\otimes 2}$ is a (finite) linear combination of tensor products of elements in the above ordered basis and it is independent of $r_{l}, l=1,2,3, \ldots$
6) From lemma 4.9 we obtain the following proposition and corollary which will be applied in the next section.
Proposition 4.10. [22] Let $r_{t}=r_{1}+r_{2} t+r_{3} t^{2}+\cdots \in \Lambda^{2}(\mathfrak{a})$ be as in Section 2, 3). Let $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{t}\right)$ be the non-degenerate triangular Lie bialgebra defined by $r_{t}$. Let $\left(\mathcal{U} \mathfrak{a}[[\hbar]], \cdot, \tilde{\Delta}_{t}, \tilde{S}_{t}, \tilde{R}_{t}\right)$ be the triangular Hopf QUE-algebra whose classical limit is the pair $\left(\mathfrak{a} ; r_{t}\right)$ and was obtained in theorem 4.2 from the usual triangular Hopf algebra $\left(\mathcal{U a}[[\hbar]], \cdot, \Delta_{\mathfrak{a}}, S_{\mathfrak{a}}, R_{\mathfrak{a}}=1\right)$ by a twist via $\left(\tilde{J}_{r_{t}}\right)^{-1}$. Consider, as before, the element $\tilde{J}_{r_{\hbar}}=\left.\left(\tilde{J}_{r_{t}}\right)\right|_{t \rightarrow \hbar} \in \mathcal{U} \mathfrak{a}[[\hbar]] \hat{\otimes} \mathcal{U} \mathfrak{a}[[\hbar]]$. Then the following equalities hold:
(a) $\left(\Delta_{\mathfrak{a}} \otimes i d\right) \tilde{J}_{r_{\hbar}} \cdot \hbar\left(\tilde{J}_{r_{\hbar}} \otimes 1\right)=\left(1 \otimes \Delta_{\mathfrak{a}}\right) \tilde{J}_{r_{\hbar}} \cdot \hbar\left(i d \otimes \tilde{J}_{r_{\hbar}}\right)$;
(b) $\tilde{J}_{r_{\hbar}}=1 \otimes 1+\frac{1}{2} r_{1} \hbar+0\left(\hbar^{2}\right)$.

Let us define $\Delta(a)=\left(\tilde{J}_{r_{\hbar}}\right)^{-1} \cdot \hbar \Delta_{\mathfrak{a}}(a) \cdot{ }_{\hbar} \tilde{J}_{r_{\hbar}}, R=\left(\sigma \tilde{J}_{r_{\hbar}}\right)^{-1} \cdot \hbar(1 \otimes 1) \cdot \hbar \tilde{J}_{r_{\hbar}}$ and $S(a)=Q^{-1} \cdot \hbar S_{\mathfrak{a}}(a) \cdot \hbar Q$, where $Q=\sum S_{\mathfrak{a}}\left(a_{i}\right) \cdot \hbar b_{i}, \tilde{J}_{r_{\hbar}}=\sum a_{i} \otimes b_{i} ; a_{i}, b_{i} \in$ $\mathcal{U} \mathfrak{a}[[\hbar]]$. The set $(\mathcal{U} \mathfrak{a}[[\hbar]], \cdot \hbar, \Delta, S, R)$ is then a triangular Hopf QUE algebra obtained twisting the usual triangular Hopf algebra $\left(\mathcal{U} \mathfrak{a}[[\hbar]], \cdot, \Delta_{\mathfrak{a}}, S_{\mathfrak{a}}, R_{\mathfrak{a}}=1 \otimes 1\right)$ via the element $\left(\tilde{J}_{r_{\hbar}}\right)^{-1} \in \mathcal{U} \mathfrak{a}[[\hbar]] \hat{\otimes} \mathcal{U} \mathfrak{a}[[\hbar]]$. We write it as $A_{\mathfrak{a}[[\hbar]],\left(\tilde{J}_{r_{h}}\right)^{-1}}$.
Corollary 4.11. Let $r_{t}^{\prime}=r_{1}+r_{2} t+r_{3} t^{2}+\cdots+r_{k-1} t^{k-2}+\left(r_{k}+s_{k}\right) t^{k-1}+\cdots \in$ $\Lambda^{2}(\mathfrak{a})$ be another element. Let $\tilde{J}_{r_{\hbar}^{\prime}}$ be the star product determined by $r_{t}^{\prime}$ in the similar way as $\tilde{J}_{r_{\hbar}}$ was from $r_{t}$. Then $\tilde{J}_{r_{\hbar}}$ and $\tilde{J}_{r_{\hbar}^{\prime}}$ coincide up to order $k-1$ and

$$
\left(\tilde{J}_{r_{\hbar}^{\prime}}\right)_{k}-\left(\tilde{J}_{r_{\hbar}}\right)_{k}=\frac{1}{2} s_{k} .
$$

## 5. ISP $F$ determines $r_{\hbar} \in(\mathfrak{a} \otimes \mathfrak{a})[[\hbar]]$. $\tilde{J}_{r_{\hbar}}^{\Phi}$ and $F$ are equivalent.

Let $F \in \mathcal{U a}[[\hbar]] \hat{\otimes} \mathcal{U} \mathfrak{a}[[\hbar]]$ be an ISP on the non-degenerate triangular Lie bialgebra $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{1}\right)$. Let $A_{\mathfrak{a}[\hbar t], F^{-1}}$ be the triangular Hopf QUE algebra obtained by a twist via $F^{-1}$ from the trivial triangular Hopf QUE algebra $\left(\mathcal{U}(\mathfrak{a})[[\hbar]], \cdot, 1, \Delta_{\mathfrak{a}}, S_{\mathfrak{a}}, R_{\mathfrak{a}}=1 \otimes 1\right)$. It is then a quantization of the pair ( $\mathfrak{a}, r_{1}$ ).

The following proposition does not depend on any specific context of quantization [19] but only on the notion of deformation of associative algebras [10], the fact that Hochschild cohomology spaces of coalgebra $(\mathcal{U} \mathfrak{a}, \mathbb{R})$ are $H^{k}(\mathcal{U} \mathfrak{a})=\Lambda^{k} \mathfrak{a}, k \in \mathbb{N}$, [3], and the Hochschild cohomological [18] interpretation of the Quantum Yang Baxter equation.

Proposition 5.1. [18] Let $F=\sum_{i}^{\infty} F_{i} \hbar^{i}$ and $F^{\prime}=\sum_{i}^{\infty} F_{i}^{\prime} \hbar^{i}$ be ISP on $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{1}\right)$. Let $A_{\mathfrak{a}\left[[h], F^{-1}\right.}$ and $A_{\mathfrak{a}[h \hbar], F^{\prime-1}}$ be as before in this section. Suppose that $F$ and $F^{\prime}$ coincide up to order $k$, i.e. $F_{l}^{\prime}=F_{l}^{\prime}, \quad l=1,2, \cdots, k$. Then: a) there exist $h_{k+1} \in \mathfrak{a} \wedge \mathfrak{a}$ and $E_{k+1} \in \mathcal{U} \mathfrak{a}$ such that $F_{k+1}^{\prime}-F_{k+1}=$ $h_{k+1}+d_{H} E_{k+1}$ where $d_{H}$ is the coboundary operator in the Hochschild cohomology of $\mathcal{U a}$; b) $h_{k+1}$ is not only a Hochschild 2-cocycle but also a Poisson 2-cocycle relative to the invariant Poisson structure defined by the element $r_{1} \in \mathfrak{a} \wedge \mathfrak{a}$.

Again, the above Hochschild cohomology spaces and proposition 5.1 play a central role in the proof of the next theorem. In the context of quantification in [9] the next theorem corresponds to a main theorem by Drinfeld in the context of quantification in [5] and in [19, 20] there is a proof of this Drinfeld theorem. See the References in [20] for a similar theorem about Star Products on general symplectic manifolds and [13] on Poisson manifolds.

Theorem 5.2. Fix a Lie associator $\Phi$. Let $A_{\mathfrak{a}[\hbar \hbar]], F^{-1}}$ be as defined at the beginning of this section. We have:
(a) There exist elements $r_{\hbar}=r_{1}+r_{2} \hbar+r_{3} \hbar^{2}+\cdots \in\left(\wedge^{2} \mathfrak{a}\right)[[\hbar]]$ and $E^{r_{\hbar}}=$ $1+E_{1}^{r_{\hbar}} \hbar+\cdots+E_{n}^{r_{\hbar}} \hbar^{n}+\cdots \in \mathcal{U} \mathfrak{a}[[\hbar]]$ such that

$$
F=\Delta_{\mathfrak{a}}\left(\left(E^{r_{\hbar}}\right)^{-1}\right) \cdot \hbar \tilde{J}_{r_{\hbar}}^{\Phi} \cdot \hbar\left(E^{r_{\hbar}} \otimes E^{r_{\hbar} \hbar}\right)
$$

i.e., $F$ and $\tilde{J}_{r_{\hbar}}^{\Phi}$ are equivalent ISPS over the non-degenerate triangular Lie bialgebra $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{1}\right)$.
(b) The triangular Hopf QUE algebras $A_{\mathfrak{a}\left[[\hbar], F^{-1}\right.}$ and $A_{\mathfrak{a}[\hbar \hbar],\left(\tilde{J}_{r_{\hbar}^{\infty}}^{\infty}\right)^{-1}}$ are isomorphic.

## Proof:

(a) We construct an analytic function

$$
r_{t}(n)=r_{1}+\sum_{l=2}^{\infty} r_{l}(n) t^{l-1} \in \wedge^{2}(\mathfrak{a})
$$

which is a non-degenerate solution of CYBE and we prove that $\tilde{J}_{r_{\hbar}(n)}^{\Phi}$ and $F$ are equivalent at order $n, n \in \mathbb{N}$, by induction on the order of equivalence. The results comes from that equivalence.
(i) Let $\tilde{J}_{r_{h}(1)}$ be the star product obtained from the E-K quantization (proposition 4.10), determined by the CYBE solution $r_{t}(1)=r_{1}$.
As $A_{\mathfrak{a}\left[[\hbar], F^{-1}\right.}$ is a quantization of the given Lie bialgebra $R=1 \otimes 1+r_{1} \hbar+\ldots$, and because it is the twist of the usual triangular Hopf QUE algebra $\left(R_{\mathfrak{a}}=\right.$ $1 \otimes 1)$ we have

$$
\begin{equation*}
F_{1}-\sigma F_{1}=r_{1} \tag{5.1}
\end{equation*}
$$

and, by construction,

$$
\begin{equation*}
\left(\tilde{J}_{r_{\hbar}(1)}\right)_{1}=\frac{1}{2} r_{1} . \tag{5.2}
\end{equation*}
$$

The associative property at order 1 for $F$ and $\tilde{J}_{r_{\hbar}(1)}$ is $d_{H} F_{1}=0$ and $d_{H}\left(\tilde{J}_{r_{\hbar}(1)}\right)_{1}=0, d_{H}$ being the Hochschild cohomology operator. Therefore, $d_{H}\left(\left(\tilde{J}_{r_{h}(1)}\right)_{1}-F_{1}\right)=0$, i.e., $\left(\tilde{J}_{r_{h}(1)}\right)_{1}-F_{1}$ is a Hochschild 2-cocycle. The 2 -cocycle condition implies that there exist $h_{1} \in \mathfrak{a} \wedge \mathfrak{a}$ and $E_{1} \in \mathcal{U} \mathfrak{a}$ such that

$$
\begin{equation*}
\left(\tilde{J}_{r_{\hbar}(1)}\right)_{1}-F_{1}=h_{1}+d_{H} E_{1} \tag{5.3}
\end{equation*}
$$

On the other hand, from (5.1) and (5.2), and because $\left(\tilde{J}_{r_{\hbar}(1)}\right)_{1}$ is skewsymmetric, we conclude that $F_{1}-\left(\tilde{J}_{r_{\hbar}(1)}\right)_{1}=\sigma\left(F_{1}-\left(\tilde{J}_{r_{\hbar}(1)}\right)_{1}\right)$, i.e., $F_{1}-\left(\tilde{J}_{r_{\hbar}(1)}\right)_{1}$ is symmetric. As $h_{1}$ is the skew-symmetric part in (5.3), we get $h_{1}=0$ and

$$
\begin{equation*}
\left(\tilde{J}_{r_{\hbar}(1)}\right)_{1}-F_{1}=d_{H} E_{1} \tag{5.4}
\end{equation*}
$$

$\tilde{J}_{r_{\hbar}(1)}$ and $F$ are equivalent to order $1\left(E^{r_{\hbar}(1)}=1+E_{1} \hbar\right)$.
(ii) $\tilde{J}_{r_{\hbar}(1)}$ and $F$ being equivalent to order 1, we know (Gerstenhaber [10]) that $\left(\tilde{J}_{r_{\hbar}(1)}\right)_{2}-F_{2}+G_{2}\left(E_{1},\left(\tilde{J}_{r_{\hbar}(1)}\right)_{1}, F_{1}\right)$ is a Hochschild 2-cocycle. Then, there
exist $h_{2} \in \mathfrak{a} \wedge \mathfrak{a}$ and $E_{2} \in \mathcal{U} \mathfrak{a}$ such that

$$
\begin{equation*}
\left(\tilde{J}_{r_{\hbar}(1)}\right)_{2}-F_{2}+G_{2}\left(E_{1},\left(\tilde{J}_{r_{\hbar}(1)}\right)_{1}, F_{1}\right)=\frac{1}{2} h_{2}+d_{H} E_{2} \tag{5.5}
\end{equation*}
$$

Put $E^{r_{h}(2)}=1+E_{1} \hbar+E_{2} \hbar^{2} \in \mathcal{U} \mathfrak{a}[[\hbar]]$ and consider the star product, equivalent to $F, F^{\prime(1)}=\Delta_{\mathfrak{a}}\left(\left(E^{r_{\hbar}(2)}\right)^{-1}\right) \cdot F \cdot\left(E^{r_{\hbar}(2)} \otimes E^{r_{\hbar}(2)}\right)$.

At first order, the equivalence condition is

$$
\begin{equation*}
F_{1}^{\prime(1)}-F_{1}=d_{H} E_{1}, \tag{5.6}
\end{equation*}
$$

and, from (5.4), we conclude that $F_{1}^{\prime(1)}=\left(\tilde{J}_{r_{\hbar}(1)}\right)_{1}$.
At order 2, the equivalence can be written in the form

$$
\begin{equation*}
F_{2}^{\prime(1)}-F_{2}+G_{2}\left(E_{1}, F_{1}^{\prime(1)}, F_{1}\right)=d_{H} E_{2} \tag{5.7}
\end{equation*}
$$

but, as $F_{1}^{\prime(1)}=\left(\tilde{J}_{r_{\hbar}(1)}\right)_{1}$, we get $G_{2}\left(E_{1}, F_{1}^{\prime(1)}, F_{1}\right)=G_{2}\left(E_{1},\left(\tilde{J}_{r_{\hbar}(1)}\right)_{1}, F_{1}\right)$ and, comparing (5.5) with (5.7), we obtain

$$
\begin{equation*}
F_{2}^{\prime(1)}=\left(\tilde{J}_{r_{\hbar}(1)}\right)_{2}-\frac{1}{2} h_{2} . \tag{5.8}
\end{equation*}
$$

As $\left(\tilde{J}_{r_{\hbar}(1)}\right)_{1}=F_{1}^{\prime(1)}, h_{2}$ is a Poisson 2-cocycle ([19]), so that $\beta_{2}=\mu_{r_{1}}\left(h_{2}\right)$ is an invariant De Rham (or Chevalley) 2-cocycle, where $\mu_{r_{1}}$ is the isomorphism defined before. We consider $\beta_{1}=\mu_{r_{1}}\left(r_{1}\right) \in \mathfrak{a}^{*} \wedge \mathfrak{a}^{*}$ (equivalent to $\left.\left(r_{1}\right)^{a b}\left(\beta_{1}\right)_{a c}=\delta_{c}^{b}\right)$ and define $\beta_{t}(2)=\beta_{1}+\beta_{2} t\left(d_{c} \beta_{t}=0\right.$ and $\beta_{1}$ is nondegenerate). Let us define $r_{t}(2)=r_{1}(2)+\sum_{k \geq 2} r_{k}(2) t^{k-1} \in \mathfrak{a} \wedge \mathfrak{a}[t t]$, by $\mu_{r_{t}(2)}^{-1}\left(\beta_{t}(2)\right)=r_{t}(2)$. Then, $r_{1}(2)=r_{1}=r_{1}(1)$ and $r_{2}(2)=-\mu_{r_{1}}^{-1}\left(\beta_{2}\right)=-h_{2}$ and $\left[r_{t}(2), r_{t}(2)\right]=0, r_{t}(2)$ is a solution of the CYBE.

Let $\tilde{J}_{r_{h}(2)}$ be the star product determined following Etingof-Kazhdan by the element $r_{t}(2)$, after $t=\hbar$, as in proposition 4.10. We have, also from proposition 4.10, that $\left(\tilde{J}_{r_{\hbar}(2)}\right)_{1}=\left(\tilde{J}_{r_{\hbar}(1)}\right)_{1}$ and $\left(\tilde{J}_{r_{h}(2)}\right)_{2}=\left(\tilde{J}_{r_{\hbar}(1)}\right)_{2}+\frac{1}{2} r_{2}(2)=$ $\left(\tilde{J}_{r_{h}(1)}\right)_{2}-\frac{1}{2} h_{2}$. Thus, $\left(\tilde{J}_{r_{h}(2)}\right)_{1}=F_{1}^{\prime(1)}=\left(\tilde{J}_{r_{h}(1)}\right)_{1}$, and from (5.8), we have $\left(\tilde{J}_{r_{h}(2)}\right)_{2}=F_{2}^{\prime(1)}$. Replacing these equalities in the expressions (5.6) and (5.7), we get

$$
\begin{aligned}
& \left(\tilde{J}_{r_{\hbar}(2)}\right)_{1}-F_{1}=d_{H} E_{1} \\
& \left(\tilde{J}_{r_{\hbar}(2)}\right)_{2}-F_{2}+G_{2}\left(E_{1},\left(\tilde{J}_{r_{\hbar}(2)}\right)_{1}, F_{1}\right)=d_{H} E_{2} .
\end{aligned}
$$

So, $F$ is equivalent to $\tilde{J}_{r_{\hbar}(2)}$, to order 2, $\tilde{J}_{r_{\hbar}(2)}$ being the star product determined by $r_{t}(2)$, with $\mu_{r_{t}(2)}^{-1}\left(\beta_{t}(2)\right)=r_{t}(2)$ and $\beta_{t}(2)=\beta_{1}+\mu_{r_{1}}\left(h_{2}\right) t$.
(iii) Using the induction hypothesis, and following the same steps, we conclude the proof.
(b) this part follows from part a) and [7] page 841, Remark 2.

As a consequence we have the following isomorphisms (see also [21]):
Corollary 5.3. Let $\Phi, \Phi^{\prime}$ be two Lie associators. Let $A_{\mathfrak{a}\left[[\hbar], F^{-1}\right.}$ be given as in the theorem. Let $r_{\hbar}, r_{\hbar}^{\prime} \in\left(\wedge^{2} \mathfrak{a}\right)[[\hbar]]$ the elements respectively determined in the theorem by the pairs $\left(\Phi ; A_{\mathfrak{a}[\hbar \hbar], F^{-1}}\right)$ and $\left(\Phi^{\prime} ; A_{\mathfrak{a}[[\hbar]], F^{-1}}\right)$. Then we have

$$
A_{\mathfrak{a}[[\hbar]], F^{-1}} \stackrel{i \text { som }}{\approx} A_{\mathfrak{a}[[\hbar]],\left(\tilde{J}_{T_{h}}\right)^{-1}} \stackrel{i \text { isom }}{\approx} A_{\mathfrak{a}[[\hbar]],\left(\tilde{J}_{T_{h}}^{p^{\prime}}\right)^{-1}}
$$

## 6. Invariant star products on $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{1}\right)$

1) We now develop what we wrote in 3) at the Introduction. We need the following proposition:

Proposition 6.1. [22] Let $\Gamma$ be a set. Let $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon=d_{c} r_{s}\right)$ be a nondegenerate triangular Lie bialgebra, $s \in \Gamma$. Let $\varphi_{s}^{1}: \mathfrak{a} \longrightarrow \mathfrak{a}$ a Lie algebra isomorphisms $\forall s \in \Gamma$. Let $r_{s}^{\prime}$ be the element in $\mathfrak{a} \wedge \mathfrak{a}$ defined by $r_{s}^{\prime}=\left(\varphi_{s}^{1} \otimes \varphi_{s}^{1}\right) r_{s}$.
a) The set $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}^{\prime}=d_{c} r_{s}^{\prime}\right)$ is a non-degenerate triangular Lie bialgebra.
b) The transposed map $\left(\varphi_{s}^{1}\right)^{\mathfrak{t}}: \mathfrak{a}_{r_{s}^{\prime}}^{*} \longrightarrow \mathfrak{a}_{r_{s}}^{*}$ is a Lie algebra isomorphism.
c) The pair $\left(\varphi_{s}^{1} ; \varphi_{s}^{2}=\left(\left(\varphi_{s}^{1}\right)^{\mathfrak{t}}\right)^{-1}\right)$, $s \in \Gamma$, defines a Lie bialgebra isomorphism between the Lie bialgebra $\mathfrak{a} \oplus \mathfrak{a}_{r_{s}}^{*}$ (the classical double of the Lie bialgebra $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{s}\right)$ ) and the Lie bialgebra $\mathfrak{a} \oplus \mathfrak{a}_{r_{s}^{\prime}}^{*}$ (the classical double of the Lie bialgebra $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}^{\prime}=d_{c} r_{s}^{\prime}\right)$ ). Furthermore, this isomorphism sends the canonical element $r$ into itself.

Corollary 6.2. [22] a) Under the hypothesis of the proposition let $\beta_{s}=$ $\mu_{r_{s}}\left(r_{s}\right), \beta_{s}^{\prime}=\mu_{r_{s}^{\prime}}\left(r_{s}^{\prime}\right)$. Then $\left(\varphi_{s}^{2} \otimes \varphi_{s}^{2}\right) \beta_{s}=\beta_{s}^{\prime}$.
b) Conversely, let $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon=d_{c} r_{s}\right)$ and $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}^{\prime}=d_{c} r_{s}^{\prime}\right)$ be non-degenerate triangular Lie bialgebras. Let $\beta_{s}$ and $\beta_{s}^{\prime}$ be as in a). Let $\varphi_{s}^{1}: \mathfrak{a} \longrightarrow \mathfrak{a}$ be a Lie algebra isomorphism and $\varphi_{s}^{2}=\left(\left(\varphi_{s}^{1}\right)^{\mathrm{t}}\right)^{-1}$. Suppose that $\left(\varphi_{s}^{2} \otimes \varphi_{s}^{2}\right) \beta_{s}=\beta_{s}^{\prime}$. Then, $\left(\varphi_{s}^{1} \otimes \varphi_{s}^{1}\right) r_{s}=r_{s}^{\prime}$.
2) Let $\left(\mathfrak{a},[,]_{\mathfrak{a}}\right)$ be a Lie algebra over $\mathbb{R}$. Consider the following Lie-algebra isomorphisms: $\varphi_{t}^{1}=\exp \left(t \cdot a d_{X_{t}}\right)$ where $X_{t}=X_{1}+X_{2} t+X_{3} t^{2}+\cdots \in \mathfrak{a}$ is an analytic function in a neighborhood of $0 \in \mathbb{R}$. Then $\varphi_{t}^{2}=\exp \left(-t \cdot a d_{X_{t}}^{t}\right)=$ $\exp \left(t \cdot a d_{X_{t}}^{*}\right)$. Our interest is in the map $\varphi_{t}^{2} \otimes \varphi_{t}^{2}=\exp \left(a d_{t X_{t}}^{*}\right)^{\otimes^{2}}$. We have $\varphi_{t}^{2} \otimes \varphi_{t}^{2}=\exp \left(a d_{t X_{t}}^{*} \otimes 1+1 \otimes a d_{t X_{t}}^{*}\right)$ and then

Proposition 6.3. Let $\beta_{t}=\beta_{1}+\beta_{2} t+\beta_{3} t^{2}+\cdots \in \wedge^{2}\left(\mathfrak{a}^{*}\right)$ be an analytic function in a neighborhood of $0 \in \mathbb{R}$ defining a non-degenerate 2 -cocycle $\forall t$. $\beta_{1}, \beta_{2}, \cdots \in \wedge^{2}\left(\mathfrak{a}^{*}\right)$ are then 2 -cocycles and $\beta_{1}$ is non-degenerate. Let $X_{t}$ be as before. Then we obtain

$$
\exp \left(a d_{t X_{t}}^{*}\right)^{\otimes^{2}}\left(\beta_{t}\right)=\exp \left(a d_{t X_{t}}^{*} \otimes 1+1 \otimes a d_{t X_{t}}^{*}\right)\left(\beta_{t}\right)=\beta_{t}+d_{c} \alpha_{t},
$$

where $\alpha_{t}=\alpha_{1} t+\alpha_{2} t^{2}+\alpha_{3} t^{3}+\cdots \in \mathfrak{a}^{*}$ is an analytic function in a neighborhood of $0 \in \mathbb{R}$ given by

$$
\alpha_{k}=\sum_{j=1}^{k}\left(\sum_{i=1}^{k-j+1} \frac{1}{i!} \sum_{\substack{a_{1}+\ldots+a_{i}=k-j+1 \\ a_{1}, \ldots, a_{i} \geq 1}}\left((-1)^{i+1}\left(i_{X_{a_{1}}} \beta_{j}\right) \cdot a d_{X_{a_{2}}} \cdots a d_{X_{a_{i}}}\right)\right) .
$$

## Proof:

The first terms of the series are:

$$
\begin{aligned}
& \exp \left(a d_{t X_{t}}^{*} \otimes 1+1 \otimes a d_{t X_{t}}^{*}\right)\left(\beta_{1}\right)=\beta_{1}+\left(1 \otimes a d_{X_{1}}^{*}+a d_{X_{1}}^{*} \otimes 1\right)\left(\beta_{1}\right) t+ \\
& \quad+\left(\left(1 \otimes a d_{X_{2}}^{*}+a d_{X_{2}}^{*} \otimes 1\right)+\frac{1}{2!}\left(1 \otimes a d_{X_{1}}^{*}+a d_{X_{1}}^{*} \otimes 1\right)^{2}\right)\left(\beta_{1}\right) t^{2}+\cdots,
\end{aligned}
$$

because

$$
\begin{align*}
& \exp \left(a d_{t X_{t}}^{*} \otimes 1+1 \otimes a d_{t X_{t}}^{*}\right)= \\
& =1 \otimes 1+\sum_{p \geq 1}\left(\sum_{i=1}^{p} \frac{1}{i!} \sum_{\substack{a_{1}+\cdots+a_{i}=p \\
a_{1}, \ldots, a_{i} \geq 1}} \prod_{j=1}^{i}\left(1 \otimes a d_{X_{a_{j}}}^{*}+a d_{X_{a_{j}}}^{*} \otimes 1\right)\right) t^{p} . \tag{6.9}
\end{align*}
$$

For any $e_{a}, e_{b} \in \mathfrak{a}$ elements in a basis, we have

$$
\begin{aligned}
\left\langle\left(1 \otimes a d_{X_{1}}^{*}+a d_{X_{1}}^{*} \otimes 1\right)\left(\beta_{1}\right) ; e_{a} \otimes e_{b}\right\rangle & =-\left\langle\beta_{1} ;\left(1 \otimes a d_{X_{1}}+a d_{X_{1}} \otimes 1\right) e_{a} \otimes e_{b}\right\rangle \\
& =-\left\langle\beta_{1} ; e_{a} \otimes\left[X_{1}, e_{b}\right]+\left[X_{1}, e_{a}\right] \otimes e_{b}\right\rangle \\
& =-X_{1}^{i} C_{i b}^{t}\left(\beta_{1}\right)_{a t}-X_{1}^{i} C_{i a}^{k}\left(\beta_{1}\right)_{k b} \\
& =X_{1}^{i} C_{a b}^{k}\left(\beta_{1}\right)_{k i} \\
& =\left(-i_{X_{1}} \beta_{1}\right)\left(\left[e_{a}, e_{b}\right]\right) \\
& =\left\langle d_{c}\left(i_{X_{1}} \beta_{1}\right) ; e_{a} \otimes e_{b}\right\rangle,
\end{aligned}
$$

where we used that $\beta_{1}$ is a 2 -cocycle $\left(\beta_{1}([x, y], z)+\beta_{1}([y, z], x)+\beta_{1}([z, x], y)=\right.$ $0, x, y, z \in \mathfrak{a}), C_{a b}^{k}$ are the structure constants of the Lie algebra $\mathfrak{a}$ in a basis $\left\{e_{i}\right\}$ and $d_{c} \alpha\left(e_{a} \otimes e_{b}\right)=-\alpha\left(\left[e_{a}, e_{b}\right]\right)$.

So, we obtain

$$
\begin{equation*}
\left(1 \otimes a d_{X_{1}}^{*}+a d_{X_{1}}^{*} \otimes 1\right)\left(\beta_{1}\right)=d\left(i_{X_{1}} \beta_{1}\right) \tag{6.10}
\end{equation*}
$$

for any cocycle $\beta_{1}$ and any $X_{1} \in \mathfrak{a}$.
With a similar computation, for any $X_{1}, X_{2} \in \mathfrak{a}$, we get

$$
\begin{equation*}
\left(1 \otimes a d_{X_{2}}^{*}+a d_{X_{2}}^{*} \otimes 1\right) \cdot\left(1 \otimes a d_{X_{1}}^{*}+a d_{X_{1}}^{*} \otimes 1\right)\left(\beta_{1}\right)=d_{c}\left(-\left(i_{X_{1}} \beta_{1}\right) \cdot a d_{X_{2}}\right) . \tag{6.11}
\end{equation*}
$$

By (6.10) and (6.11), we have

$$
\begin{aligned}
\exp \left(a d_{t X}^{*} \otimes 1+1 \otimes a d_{t X}^{*}\right) & \left(\beta_{1}\right)=\beta_{1}+d_{c}\left(i_{X_{1}} \beta_{1}\right) t+ \\
& +\left(d_{c}\left(i_{X_{2}} \beta_{1}\right)+\frac{1}{2!} d_{c}\left(-\left(i_{X_{1}} \beta_{1}\right) \cdot a d_{X_{1}}\right)\right) t^{2}+\ldots
\end{aligned}
$$

By induction it is possible to prove that, for any $n, X_{1}, X_{2}, \ldots, X_{n} \in \mathfrak{a}$ and any cocycle $\beta_{1}$,

$$
\begin{aligned}
\left(1 \otimes a d_{X_{n}}^{*}\right. & \left.+a d_{X_{n}}^{*} \otimes 1\right) \cdots\left(1 \otimes a d_{X_{2}}^{*}+a d_{X_{2}}^{*} \otimes 1\right) \cdot\left(1 \otimes a d_{X_{1}}^{*}+a d_{X_{1}}^{*} \otimes 1\right) \beta_{1}= \\
& =d_{c}\left((-1)^{n+1}\left(i_{X_{1}} \beta_{1}\right) \cdot a d_{X_{2}} \cdots a d_{X_{n-1}} \cdot a d_{X_{n}}\right)
\end{aligned}
$$

With this result, and from (6.9), it is clear that

$$
\exp \left(a d_{t X_{t}}^{*} \otimes 1+1 \otimes a d_{t X_{t}}^{*}\right)\left(\beta_{1}\right)=\beta_{1}+d_{c} \gamma_{t}
$$

where $\gamma_{t}=\gamma_{1} t+\gamma_{2} t^{2}+\ldots$ is the 1-cochain given by

$$
\gamma_{k}=\sum_{i=1}^{k} \frac{1}{i!} \sum_{\substack{a_{1}+\cdots+a_{i}=k \\ a_{1}, \ldots, a_{i} \geq 1}}\left((-1)^{i+1}\left(i_{X_{a_{1}}} \beta_{1}\right) \cdot a d_{X_{a_{2}}} \cdots a d_{X_{a_{i}}}\right) .
$$

Since, for each $t, X_{t} \in \mathfrak{a}$ and $\exp \left(a d_{t X_{t}}\right): \mathfrak{a} \longrightarrow \mathfrak{a}$, we have $\exp \left(a d_{t X_{t}}^{*}\right)$ : $\mathfrak{a}^{*} \longrightarrow \mathfrak{a}^{*}$, i.e., $\beta_{1}+d_{c} \gamma_{t} \in \mathfrak{a}^{*}$, so $d_{c} \gamma_{t} \in \mathfrak{a}^{*}$, for each $t$.

Applying this result to the cocycles $\beta_{1}, \beta_{2}, \beta_{3}, \ldots$, we get the expression given.

A converse of proposition 6.3 is:
Proposition 6.4. Let $\beta_{t}=\beta_{1}+\beta_{2} t+\beta_{3} t^{2}+\cdots \in \wedge^{2}\left(\mathfrak{a}^{*}\right)$ as in proposition 6.3. Let $\alpha_{t}=\alpha_{1} t+\alpha_{2} t^{2}+\alpha_{3} t^{3}+\cdots \in \mathfrak{a}^{*}$ be an analytic function. Define $\beta_{t}^{\prime}=$ $\beta_{t}+d_{c} \alpha_{t}$. Then, there exists a unique $X_{t}=X_{1}+X_{2} t+X_{3} t^{2}+\cdots \in \mathfrak{a}$, analytic,
such that $\exp \left(a d_{t X_{t}}^{*}\right)^{\otimes^{2}}\left(\beta_{t}\right)=\beta_{t}^{\prime}$, where $X_{p}=-\left(\omega_{p} \otimes 1\right) r_{1}=-\chi_{r_{1}}\left(\omega_{p}\right), r_{1}=$ $\mu_{r_{1}}^{-1}\left(\beta_{1}\right), \omega_{1}=\alpha_{1}$ and, for $p \geq 2$,

$$
\begin{aligned}
\omega_{p}= & \alpha_{p}-\sum_{i=2}^{p} \frac{1}{i!} \sum_{\substack{a_{1}+\cdots+a_{i}=p \\
a_{1}, \ldots, a_{i} \geq 1}}\left((-1)^{i+1}\left(i_{X_{a_{1}}} \beta_{1}\right) \cdot a d_{X_{a_{2}}} \cdots a d_{X_{a_{i}}}\right) \\
& -\sum_{j=2}^{p}\left(\sum_{i=1}^{p-j+1} \frac{1}{i!} \sum_{\substack{a_{1}+\cdots+a_{i}=p-j+1 \\
a_{1}, \ldots, a_{i} \geq 1}}\left((-1)^{i+1}\left(i_{X_{a_{1}}} \beta_{j}\right) \cdot a d_{X_{a_{2}}} \cdots a d_{X_{a_{i}}}\right)\right)
\end{aligned}
$$

## Proof:

By the previous theorem, we know that, for any $X_{t} \in \mathfrak{a}$ in the above form, we have

$$
\exp \left(a d_{t X_{t}}^{*}\right)^{\otimes^{2}}\left(\beta_{t}\right)=\beta_{t}+d_{c} \alpha_{t}
$$

where $\alpha_{t}=\alpha_{1} t+\alpha_{2} t^{2}+\cdots \in \mathfrak{a}^{*}$ is the 1-cochain of theorem 6.3. The question now is to know if it is possible to determine $X_{t}=X_{1}+X_{2} t+X_{3} t^{2}+\ldots$ in such a way that this 1-cochain $\alpha_{t}$ is equal to the 1-cochain given $\alpha_{t}=$ $\alpha_{1} t+\alpha_{2} t^{2}+\ldots$ The elements $X_{1}, X_{2}, \cdots \in \mathfrak{a}$ must satisfy

$$
\begin{aligned}
& \alpha_{1}=i_{X_{1}} \beta_{1} \\
& \alpha_{2}=i_{X_{2}} \beta_{1}-\frac{1}{2!}\left(i_{X_{1}} \beta_{1}\right) \cdot a d_{X_{1}}+i_{X_{1}} \beta_{2}
\end{aligned}
$$

Since $\beta_{1}$ is non-degenerate, the first equality has a (unique) solution

$$
X_{1}=-\left(\alpha_{1} \otimes 1\right) r_{1}=-\chi_{r_{1}}\left(\alpha_{1}\right)
$$

where $r_{1}=\mu_{r_{1}}^{-1}\left(\beta_{1}\right)$ and $\chi_{r_{1}}$ is the map defined before.
From the second equality, $X_{1}$ is known and $\beta_{1}$ being non-degenerate, we obtain

$$
X_{2}=-\chi_{r_{1}}\left(\alpha_{2}+\frac{1}{2!}\left(i_{X_{1}} \beta_{1}\right) \cdot a d_{X_{1}}-i_{X_{1}} \beta_{2}\right)
$$

Suppose now that we know $X_{1}, X_{2}, \ldots, X_{p-1}$. Putting $\alpha_{p}$ equal to the expression given in theorem 6.3 with $k=p$ and separating some terms of the
sum, we obtain

$$
\begin{align*}
& \alpha_{p}=i_{X_{p}} \beta_{1}+\sum_{i=2}^{p} \frac{1}{i!} \sum_{\substack{a_{1}+\cdots+a_{i}=p \\
a_{1}, \ldots, a_{i} \geq 1}}\left((-1)^{i+1}\left(i_{X_{a_{1}}} \beta_{1}\right) \cdot a d_{X_{a_{2}}} \cdots a d_{X_{a_{i}}}\right)+ \\
& +\sum_{j=2}^{p}\left(\sum_{i=1}^{p-j+1} \frac{1}{i!} \sum_{\substack{a_{1}+\cdots+a_{i}=p-j+1 \\
a_{1}, \ldots, a_{i} \geq 1}}\left((-1)^{i+1}\left(i_{X_{a_{1}}} \beta_{j}\right) \cdot a d_{X_{a_{2}}} \cdots a d_{X_{a_{i}}}\right)\right) \tag{6.12}
\end{align*}
$$

Consider the 1-cochain

$$
\begin{aligned}
& \omega_{p}=\alpha_{p}-\sum_{i=2}^{p} \frac{1}{i!} \sum_{\substack{a_{1}+\cdots+a_{i}=p \\
a_{1}, \ldots, a_{i} \geq 1}}\left((-1)^{i+1}\left(i_{X_{a_{1}}} \beta_{1}\right) \cdot a d_{X_{a_{2}}} \cdots a d_{X_{a_{i}}}\right) \\
& -\sum_{j=2}^{p}\left(\sum_{i=1}^{p-j+1} \frac{1}{i!} \sum_{\substack{a_{1}+\ldots+a_{i}=p-j+1 \\
a_{1}, \ldots, a_{i} \geq 1}}\left((-1)^{i+1}\left(i_{X_{a_{1}}} \beta_{j}\right) \cdot a d_{X_{a_{2}}} \cdots a d_{X_{a_{i}}}\right)\right), \quad p \geq 2 .
\end{aligned}
$$

We may say that, knowing $X_{1}, X_{2}, \ldots, X_{p-1}, \omega_{p}$ is determined.
Again, as $\beta_{1}$ is non-degenerate, we can compute $X_{p}$, using $\omega_{p}$ and the equality (6.12):

$$
X_{p}=-\chi_{r_{1}}\left(\omega_{p}\right)=-\left(\omega_{p} \otimes 1\right) r_{1} .
$$

By the bijectivity between $\beta_{t}^{\prime}$ and $X_{t}$ is is easy to see that if one of them is convergent so is the other.
3) We need to relate the Etingof-Kazhdan quantization of classical doubles with the isomorphisms between these doubles. Even if the following proposition could be expected its proof is not trivial.

Proposition 6.5. [22] Let $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{s}\right)$ and $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}^{\prime}=d_{c} r_{s}^{\prime}\right)$ be nondegenerate triangular Lie bialgebras, $s \in \Gamma$, whose quasitriangular double Liebialgebras are respectively $\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{s}}^{*},[,]_{\mathfrak{a} \oplus \mathfrak{a}_{s}^{*}}^{*}, \varepsilon_{\mathfrak{a} \oplus \mathfrak{a}_{r_{s}}^{*}}=d_{c} r\right)$ and $\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{s}}^{*},[,]_{\mathfrak{a} \oplus \mathfrak{a}_{r_{s}^{*}}^{*}}, \varepsilon_{\mathfrak{a} \oplus \mathfrak{a}_{r_{s}}^{*}}=\right.$ $\left.d_{c} r\right)$. Let $\left(\varphi_{s}^{1} ; \psi_{s}\right): \mathfrak{a} \oplus \mathfrak{a}_{r_{s}}^{*} \longrightarrow \mathfrak{a} \oplus \mathfrak{a}_{r_{s}^{\prime}}^{*}$ be a Lie algebra isomorphism such that $\varphi_{s}^{1}: \mathfrak{a} \longrightarrow \mathfrak{a}$ and $\psi_{s}: \mathfrak{a}_{r_{s}}^{*} \longrightarrow \mathfrak{a}_{r_{s}^{\prime}}^{*}$ are Lie algebra isomorphisms. Let $\tilde{\varphi}_{s}^{1}$, $\tilde{\psi}_{s}$ be the extensions of $\varphi_{s}^{1}$ and $\psi_{s}$ to homomorphisms $\mathcal{U a}[[\hbar]] \longrightarrow \mathcal{U} \mathfrak{a}[[\hbar]]$ and $\mathcal{U} \mathfrak{a}_{r_{s}}^{*}[[\hbar]] \longrightarrow \mathcal{U} \mathfrak{a}_{r_{s}^{\prime}}^{*}[[\hbar]]$ respectively. Let $X \in \mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{s}}^{*}\right)^{\otimes^{2}}$. Let $\phi_{r_{s}}$ be the $\mathfrak{a} \oplus \mathfrak{a}_{r_{s}}^{*}$-module isomorphism from $\mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{s}}^{*}\right)$ to $M_{+}^{r_{s}} \otimes M_{-}^{r_{s}}$ such that
$\left.\phi_{r_{s}}\left(1_{\mathcal{U}\left(\mathfrak{a} \oplus a_{r}^{*} s\right.}\right)\right)=1_{+}^{r_{s}} \otimes 1_{-}^{r_{s}}$ and similarly for $\phi_{r_{s}^{\prime}}$. See the definition of $\phi$ in theorem 3.2). Then we have

$$
\phi_{r_{s}^{\prime}}^{-1}\left[\left(\left(\tilde{\varphi}_{s}^{1} ; \tilde{\psi}_{s}\right)^{\otimes^{2}}(X)\right) \cdot\left(1_{+}^{r_{s}^{\prime}} \otimes 1_{-}^{r_{s}^{\prime}}\right)\right]=\left(\left(\tilde{\varphi}_{s}^{1} ; \tilde{\psi}_{s}\right) \circ \phi_{r_{s}}^{-1}\right)\left(X \cdot\left(1_{+}^{r_{s}} \otimes 1_{-}^{r_{s}}\right)\right) .
$$

If in the expression of $J$ given in theorem 3.2 we take into account the above proposition and also that a Lie associator determines $\Phi=e^{P\left(\hbar \Omega_{12}, \hbar \Omega_{23}\right)}$ we arrive [22] to:
Proposition 6.6. Hypotheses are as in the above proposition and suppose moreover that $\left(\varphi_{s}^{1} ; \psi_{s}\right) \otimes\left(\varphi_{s}^{1} ; \psi_{s}\right) \Omega=\Omega$. Denote by $J_{r_{s}^{\prime}}$ and $J_{r_{s}}$ the corresponding elements in theorem 3.2. Then we have the equality $J_{r_{s}^{\prime}}=\left(\tilde{\varphi}_{s}^{1} ; \tilde{\psi}_{s}\right)^{\otimes^{2}} J_{r_{s}}$. In particular this proposition is valid for the Lie bialgebra isomorphism $\left(\varphi_{s}^{1} ; \varphi_{s}^{2}\right)$ constructed in proposition 6.1 and those in propositions 6.3 and 6.4 .

We can also prove the following:
Proposition 6.7. Let $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{s}\right)$ and $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}^{\prime}=d_{c} r_{s}^{\prime}\right)$ be nondegenerate triangular Lie bialgebras, $s \in \Gamma$. Let $\varphi_{s}^{1}: \mathfrak{a} \longrightarrow \mathfrak{a}$ be a Lie algebra isomorphism such that $r_{s}^{\prime}=\left(\varphi_{t}^{1} \otimes \varphi_{s}^{1}\right) r_{s}$ and let $\left(\varphi_{s}^{1} ; \varphi_{s}^{2}\right)$ be the Lie bialgebra isomorphism between the corresponding classical doubles constructed in proposition 6.1. Then we have

$$
\tilde{\pi}_{s}^{\prime} \circ\left(\varphi_{s}^{1} ; \varphi_{s}^{2}\right)=\varphi_{s}^{1} \circ \tilde{\pi}_{s},
$$

where $\tilde{\pi}$ is defined in Proposition 3.4.
4) Using propositions 6.1, 6.6, 6.7 and corollary 6.2 we can prove:

Theorem 6.8. Let $\tilde{J}_{r_{\hbar}}$ and $\tilde{J}_{r_{\hbar}^{\prime}}$ be invariant star products on a non-degenerate triangular Lie bialgebra over $\mathbb{R},\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{1}\right)$, and determined as in lemma 4.9 and propositions 4.10, respectively by non-degenerate skew-symmetric solutions $r_{\hbar}=r_{1}+\cdots$ and $r_{\hbar}^{\prime}=r_{1}+\cdots$ of YBE on Lie algebra over $\mathbb{R}[[\hbar]],\left(\mathfrak{a}[[\hbar]],[,]_{\mathfrak{a}[\hbar \hbar]}\right)$. Let $\mu_{r_{\hbar}}\left(r_{\hbar}\right)=\beta_{\hbar}=\beta_{1}+\beta_{2} \hbar+\cdots \in\left(\mathfrak{a}^{*} \wedge \mathfrak{a}^{*}\right)[[\hbar]]$ and $\mu_{r_{\hbar}^{\prime}}\left(r_{\hbar}^{\prime}\right)=\beta_{\hbar}^{\prime}=\beta_{1}+\beta_{2}^{\prime} \hbar+\cdots \in\left(\mathfrak{a}^{*} \wedge \mathfrak{a}^{*}\right)[[\hbar]]$. Suppose that the cocycles $\beta_{\hbar}=\mu_{r_{\hbar}}\left(r_{\hbar}\right)=\beta_{1}+\beta_{2} \hbar+\ldots$ and $\beta_{\hbar}^{\prime}=\mu_{r_{\hbar}^{\prime}}\left(r_{\hbar}^{\prime}\right)=\beta_{1}+\beta_{2}^{\prime} \hbar+\ldots$ belong to the same cohomological class, i.e., that $\beta_{\hbar}^{\prime}=\beta_{\hbar}+d_{c} \alpha_{\hbar}$ for some 1-cochain $\alpha_{\hbar}=\alpha_{1} \hbar+\alpha_{2} \hbar^{2}+\cdots \in \mathfrak{a}^{*}[[\hbar]]$. Then, $\tilde{J}_{r_{\hbar}}$ and $\tilde{J}_{r_{\hbar}^{\prime}}$ are equivalent ISP.

## Proof:

The elements $\tilde{J}_{r_{t}}$ and $\tilde{J}_{r_{t}^{\prime}}$ are defined by

$$
\tilde{J}_{r_{t}}=\left(\tilde{\pi}_{t} \otimes \tilde{\pi}_{t}\right) J_{r_{t}}, \quad \tilde{J}_{r_{t}^{\prime}}=\left(\tilde{\pi}_{t}^{\prime} \otimes \tilde{\pi}_{t}^{\prime}\right) J_{r_{t}^{\prime}},
$$

where $J_{r_{t}}$ and $J_{r_{t}^{\prime}}$ are the elements in $\mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}\right)^{\otimes^{2}}[[\hbar]]$ and $\mathcal{U}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{t}^{\prime}}^{*}\right)^{\otimes^{2}}[[\hbar]]$, respectively, defined in theorem 3.2.

Since $\beta_{t}, \beta_{t}^{\prime} \in \wedge^{2}\left(\mathfrak{a}^{*}\right)$ belong to the same cohomological class, by theorem 6.4, there exists a $X_{t}=X_{1}+X_{2} t+\cdots \in \mathfrak{a}$ such that

$$
\exp \left(a d_{t X_{t}}^{*}\right)^{\otimes^{2}}\left(\beta_{t}\right) \equiv\left(\varphi_{t}^{2}\right)^{\otimes^{2}} \beta_{t}=\beta_{t}^{\prime} .
$$

By proposition 6.2, $\varphi_{t}^{1}=\left(\left(\exp \left(a d_{t X_{t}}^{*}\right)\right)^{-1}\right)^{\mathfrak{t}}=\exp \left(a d_{t X_{t}}\right)$ is a Lie algebra isomorphism $\mathfrak{a} \longrightarrow \mathfrak{a}$ such that $\left(\varphi_{t}^{1} \otimes \varphi_{t}^{1}\right) r_{t}=r_{t}^{\prime}$, where $r_{t}=\mu_{r_{t}}^{-1}\left(\beta_{t}\right)$ and $r_{t}^{\prime}=\mu_{r_{t}^{\prime}}^{-1}\left(\beta_{t}^{\prime}\right)$. By proposition 6.1, $\left(\varphi_{t}^{1} ; \varphi_{t}^{2}\right)$ is a Lie bialgebra isomorphism between $\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}$ and $\mathfrak{a} \oplus \mathfrak{a}_{r_{t}^{\prime}}^{*}$ such that $\left(\varphi_{t}^{1} ; \varphi_{t}^{2}\right) \otimes^{2} r=r$, where $r$ is the canonical element in $\left(\mathfrak{a} \oplus \mathfrak{a}^{*}\right) \otimes\left(\mathfrak{a} \oplus \mathfrak{a}^{*}\right)$. So, $\left(\varphi_{t}^{1} ; \varphi_{t}^{2}\right)^{\otimes^{2}} \Omega=\Omega$.

Then, we have

$$
\tilde{J}_{r_{t}^{\prime}}=\left(\tilde{\pi}_{t}^{\prime} \otimes \tilde{\pi}_{t}^{\prime}\right) J_{r_{t}^{\prime}}=\left(\tilde{\varphi}_{t}^{1} \otimes \tilde{\varphi}_{t}^{1}\right) \tilde{J}_{r_{t}}
$$

using propositions 6.6 and 6.7.
Putting $t=\hbar$, we obtain $\tilde{J}_{r_{\hbar}^{\prime}}=\left(\tilde{\varphi}_{\hbar}^{1} \otimes \tilde{\varphi}_{\hbar}^{1}\right) \tilde{J}_{r_{\hbar}}$, or, equivalently, $\tilde{J}_{r_{\hbar}^{\prime}}^{-1}=$ $\left(\tilde{\varphi}_{\hbar}^{1} \otimes \tilde{\varphi}_{\hbar}^{1}\right) \tilde{J}_{r_{\hbar}}^{-1}$. The map $\varphi_{\hbar}^{1}=\exp \left(a d_{\hbar X_{\hbar}}\right): \mathfrak{a}[[\hbar]] \longrightarrow \mathfrak{a}[[\hbar]]$ is obviously a morphism (in fact, an isomorphism) of Lie algebras over $\mathbb{R}[[\hbar]]$ (where the Lie algebra structure on $\mathfrak{a}[[\hbar]]$ is the trivial one of $(\mathfrak{a}, \mathbb{R})$ by extension of the ring of the scalars from $\mathbb{R}$ to $\mathbb{R}[[\hbar]]$ ) and, considering $u=1$ and the last equality, we may apply proposition 3.9 in [6].

Then, the extension $\tilde{\varphi}_{\hbar}^{1}: \mathcal{U}(\mathfrak{a}[[\hbar]]) \longrightarrow \mathcal{U}(\mathfrak{a}[[\hbar]])$ is a morphism of triangular Hopf QUE algebras $A_{\mathfrak{a}[\hbar]], \tilde{J}_{\hbar_{h}}^{-1}} \longrightarrow A_{\mathfrak{a}\left[[\hbar],, \tilde{J}_{r_{\hbar}^{\prime}}^{-1}\right.}$. The pairs $\left(\varphi_{\hbar}^{1}, 1\right)$ and $\left(\lambda_{1}, u_{1}\right)$ determine the same morphism if, and only if, $\lambda_{1}=\exp \left(-\hbar a d_{v}\right) \circ \varphi_{\hbar}^{1}$ and $u_{1}=e^{\hbar v}$, for some $v \in \mathfrak{a}[[\hbar]]$. Putting $v=\left.X_{t}\right|_{t=\hbar}$, we obtain $\lambda_{1}=1$, $u_{1}=e^{\hbar X_{\hbar}}$ and

$$
\tilde{J}_{r_{\hbar}^{\prime}}^{-1}=\left(u_{1} \otimes u_{1}\right) \cdot \hbar \tilde{J}_{r_{\hbar}}^{-1} \cdot \hbar \Delta_{\mathfrak{a}}\left(u_{1}\right)^{-1} .
$$

This last equality is equivalent to

$$
\tilde{J}_{r_{\hbar}^{\prime}}=\Delta_{\mathfrak{a}}\left(u_{1}\right) \cdot \hbar \tilde{J}_{r_{\hbar}} \cdot \hbar\left(u_{1}^{-1} \otimes u_{1}^{-1}\right)
$$

and $u_{1}^{-1}$ defines an equivalence between the invariant star products $\tilde{J}_{r_{\hbar}}$ and $\tilde{J}_{r_{\hbar}^{\prime}}$ on $\left(\mathfrak{a},[,]_{\mathfrak{a}}, \varepsilon_{\mathfrak{a}}=d_{c} r_{1}\right)$.

Before proving the converse result we need the following lemma.

Lemma 6.9. Suppose that in theorem 6.8

$$
\begin{aligned}
\beta_{\hbar} & =\mu_{r_{\hbar}}\left(r_{\hbar}\right) \\
\beta_{\hbar}^{\prime} & \left.=\beta_{1}+\beta_{2}^{\prime} \hbar+\cdots+\beta_{R-1} t^{R-2}+\beta_{R} \hbar^{R-1}\right)=\beta_{1}+\beta_{2} \hbar+\cdots+\beta_{R-1} \hbar^{R-2}+\left(\beta_{R}+d_{c} \alpha_{R-1}\right) \hbar^{R-1}+\ldots,
\end{aligned}
$$

where $\alpha_{R-1}$ is a 1-cochain. This means that $\beta_{\hbar}$ and $\beta_{\hbar}^{\prime}$ are equal except in the term of order $R-1$. Then, $\tilde{J}_{r_{\hbar}}$ and $\tilde{J}_{r_{\hbar}^{\prime}}$ are equivalent,

$$
\tilde{J}_{r_{\hbar}^{\prime}}=\Delta_{\mathfrak{a}}(E)^{-1} \cdot \hbar \tilde{J}_{r_{\hbar}} \cdot \hbar(E \otimes E),
$$

and the element $E=1+E_{1} \hbar+E_{2} \hbar^{2}+\cdots+E_{R-1} \hbar^{R-1}+\ldots$ which defines this equivalence verifies

$$
E_{1}=0, \quad E_{2}=0, \quad \cdots \quad, \quad E_{R-2}=0, \quad E_{R-1}=\chi_{r_{1}}\left(\alpha_{R-1}\right)=\mu_{r_{1}}^{-1}\left(\alpha_{R-1}\right) .
$$

## Proof:

Consider the elements $\beta_{\hbar}$ and $\beta_{\hbar}^{\prime}$ obeying the above conditions. One of the steps of the proof of theorem 6.8 is to find the element $X_{t}=X_{1}+X_{2} t+X_{3} t^{2}+$ $\cdots+X_{R-1} t^{R-2}+\ldots$ of theorem 6.4. For the elements $\beta_{t}$ and $\beta_{t}^{\prime}$ considered, this element will be

$$
X_{1}=0, \quad X_{2}=0, \quad \ldots \quad, \quad X_{R-2}=0, \quad X_{R-1}=-\chi_{r_{1}}\left(\alpha_{R-1}\right)
$$

Then, the element $E$ will be, in view of the same proof, the following:

$$
E=u_{1}^{-1}=\left(e^{\hbar X_{\hbar}}\right)^{-1}=1+0 \hbar+\cdots+0 \hbar^{R-2}+\chi_{r_{1}}\left(\alpha_{R-1}\right) \hbar^{R-1}+\cdots .
$$

Lemma 6.9 and Hochschild cohomology properties allow us to prove
Theorem 6.10. Let $\tilde{J}_{r_{\hbar}}$ and $\tilde{J}_{r_{\hbar}^{\prime}}$ as in a) Theorem 6.8. Suppose $\tilde{J}_{r_{\hbar}}$ and $\tilde{J}_{r_{\hbar}^{\prime}}$ are equivalent. Then, $\beta_{\hbar}$ and $\beta_{\hbar}^{\prime}$ belong to the same cohomological class, i.e., there exists a formal 1 -cochain $\alpha_{\hbar}=\alpha_{1} \hbar+\alpha_{2} \hbar^{2}+\cdots \in \mathfrak{a}^{*}[[\hbar]]$ such that $\beta_{\hbar}^{\prime}=\beta_{\hbar}+d_{c} \alpha_{\hbar}$.

## Proof:

If $\tilde{J}_{r_{\hbar}}$ and $\tilde{J}_{r_{\hbar}^{\prime}}$ are equivalent ISP, there exists $E^{(1)}=1+E_{1}^{(1)} \hbar+E_{2}^{(1)} \hbar^{2}+\cdots \in$ $\mathcal{U} \mathfrak{a}[[\hbar]]$ such that

$$
\tilde{J}_{r_{\hbar}^{\prime}}=\Delta_{\mathfrak{a}}\left(E^{(1)}\right)^{-1} \cdot \hbar \tilde{J}_{r_{\hbar}} \cdot \hbar\left(E^{(1)} \otimes E^{(1)}\right) .
$$

At order 1, this equivalence may be written as $\left(\tilde{J}_{r_{\hbar}^{\prime}}\right)_{1}-\left(\tilde{J}_{r_{\hbar}}\right)_{1}=d_{H} E_{1}^{(1)}$, where $d_{H}$ is the Hochschild cohomology operator and $E_{1}^{(1)} \in \mathcal{U} \mathfrak{a}$. But, in this case,
$\left(\tilde{J}_{r_{\hbar}^{\prime}}\right)_{1}=\left(\tilde{J}_{r_{\hbar}}\right)_{1}=\frac{1}{2} r_{1}$. So, we have $d_{H} E_{1}^{(1)}=0$, which implies that $E_{1}^{(1)} \in \mathfrak{a}$. Therefore, $\Delta_{\mathfrak{a}}\left(E_{1}^{(1)}\right)=E_{1}^{(1)} \otimes 1+1 \otimes E_{1}^{(1)}$.

At order 2, there exists $E_{2}^{(1)} \in \mathcal{U} \mathfrak{a}$ such that

$$
\begin{equation*}
\left(\tilde{J}_{r_{\hbar}^{\prime}}\right)_{2}-\left(\tilde{J}_{r_{\hbar} \hbar}\right)_{2}+G_{2}\left(E_{1}^{(1)},\left(\tilde{J}_{r_{\hbar}^{\prime}}\right)_{1},\left(\tilde{J}_{r_{\hbar}}\right)_{1}\right)=d_{H} E_{2}^{(1)} \tag{6.13}
\end{equation*}
$$

where, for $k=2,3, \ldots$,

$$
\begin{aligned}
& G_{k}\left(E_{1}, \ldots, E_{k-1}, F_{1}^{\prime}, \ldots, F_{k-1}^{\prime}, F_{1}, \ldots, F_{k-1}\right)= \\
& =\sum_{\substack{i+j=k \\
i, j \geq 1}}\left(\Delta_{\mathfrak{a}}\left(E_{i}\right) \cdot F_{j}^{\prime}-F_{i} \cdot\left(1 \otimes E_{j}\right)-F_{i} \cdot\left(E_{j} \otimes 1\right)\right)-\sum_{\substack{i+j=k \\
i, j \geq 1}}\left(E_{i} \otimes 1\right) \cdot\left(1 \otimes E_{j}\right)- \\
& \quad-\sum_{\substack{i+j+l=k \\
i, j, l \geq 1}} F_{i} \cdot\left(E_{j} \otimes 1\right) \cdot\left(1 \otimes E_{l}\right)
\end{aligned}
$$

Since $\left(\tilde{J}_{r_{\hbar}^{\prime}}\right)_{1}=\left(\tilde{J}_{r_{\hbar}}\right)_{1}=\frac{1}{2} r_{1}$, we have

$$
\begin{aligned}
& G_{2}\left(E_{1}^{(1)},\left(\tilde{J}_{r_{\hbar}^{\prime}}\right)_{1},\left(\tilde{J}_{r_{\hbar}}\right)_{1}\right)= \\
& \quad=\Delta_{\mathfrak{a}}\left(E_{1}^{(1)}\right) \cdot \frac{1}{2} r_{1}-\frac{1}{2} r_{1} \cdot\left(1 \otimes E_{1}^{(1)}+E_{1}^{(1)} \otimes 1\right)-E_{1}^{(1)} \otimes E_{1}^{(1)} \\
& \quad=-\frac{1}{2} d_{P}^{r_{1}} E_{1}^{(1)}-E_{1}^{(1)} \otimes E_{1}^{(1)} .
\end{aligned}
$$

The skew-symmetric part of $G_{2}\left(E_{1}^{(1)},\left(\tilde{J}_{r_{\hbar}^{\prime}}\right)_{1},\left(\tilde{J}_{r_{\hbar}}\right)_{1}\right)$ is $-\frac{1}{2} d_{P}^{r_{1}} E_{1}^{(1)}$, where $d_{P}^{r_{1}}$ is the Poisson cohomology operator. We know that $\left(\tilde{J}_{r_{\hbar}^{\prime}}\right)_{2}-\left(\tilde{J}_{r_{\hbar}}\right)_{2}=\frac{1}{2}\left(r_{2}^{\prime}-r_{2}\right)$. So, the equality between the skew-symmetric parts of both sides of (6.13) leads to

$$
\begin{equation*}
r_{2}^{\prime}=r_{2}+d_{P}^{r_{1}} E_{1}^{(1)} \tag{6.14}
\end{equation*}
$$

Let $\beta_{t}=\mu_{r_{t}}\left(r_{t}\right)=\beta_{1}+\beta_{2} t+\ldots$ and $\beta_{t}^{\prime}=\beta_{t}^{(1)}=\mu_{r_{t}^{\prime}}\left(r_{t}^{\prime}\right)=\beta_{1}+\beta_{2}^{\prime} t+\beta_{3}^{\prime} t^{2}+\ldots$.
Using (6.14), we get $\beta_{2}^{\prime}-\beta_{2}=-\mu_{r_{1}}\left(r_{2}^{\prime}-r_{2}\right)=-\mu_{r_{1}}\left(d_{P}^{r_{1}} E_{1}^{(1)}\right)=d_{c}\left(\mu_{r_{1}}\left(E_{1}^{(1)}\right)\right)$ (the last equality, using relation $\left.\mu \circ\left(-d_{P}\right)=d_{c} \circ \mu\right)$. This means that there exists a 1-cochain $\alpha_{1}=\mu_{r_{1}}\left(E_{1}^{(1)}\right)$ such that $\beta_{2}^{\prime}=\beta_{2}+d_{c} \alpha_{1}$.

Consider now the following elements:

$$
\beta_{t}^{(2)}=\beta_{1}+\beta_{2} t+\beta_{3}^{\prime} t^{2}+\beta_{4}^{\prime} t^{3}+\ldots \quad \text { and } \quad r_{t}^{(2)}=\mu_{r_{t}^{(2)}}^{-1}\left(\beta_{t}^{(2)}\right)
$$

The elements $\beta_{t}^{(2)}$ and $\beta_{t}^{\prime}$ belong to the same formal cohomological class. By theorem 6.8, the star products $\tilde{J}_{r_{\hbar}^{(2)}}$ and $\tilde{J}_{r_{\hbar}^{\prime}}$ are equivalent, and the element
$u^{(2)}$ which defines the equivalence

$$
\tilde{J}_{r_{\hbar}^{\prime}}=\Delta_{\mathfrak{a}}\left(u^{(2)}\right)^{-1} \cdot \tilde{J}_{r_{\hbar}^{(2)}} \cdot\left(u^{(2)} \otimes u^{(2)}\right),
$$

equivalent also to

$$
\tilde{J}_{r_{\hbar}^{(2)}}=\Delta_{\mathfrak{a}}\left(u^{(2)}\right) \cdot \tilde{J}_{r_{\hbar}^{\prime}} \cdot\left(\left(u^{(2)}\right)^{-1} \otimes\left(u^{(2)}\right)^{-1}\right)
$$

satisfies (by the previous lemma)

$$
u^{(2)}=1+\mu_{r_{1}}^{-1}\left(\alpha_{1}\right) \hbar+\cdots=1+E_{1}^{(1)} \hbar+\cdots .
$$

But, as $\tilde{J}_{r_{\hbar}}$ and $\tilde{J}_{r_{\hbar}^{\prime}}$ are also equivalent, we obtain

$$
\begin{aligned}
\tilde{J}_{r_{\hbar}^{(2)}} & =\Delta_{\mathfrak{a}}\left(u^{(2)}\right) \cdot \Delta_{\mathfrak{a}}\left(E^{(1)}\right)^{-1} \cdot \tilde{J}_{r_{\hbar}} \cdot\left(E^{(1)} \otimes E^{(1)}\right) \cdot\left(\left(u^{(2)}\right)^{-1} \otimes\left(u^{(2)}\right)^{-1}\right) \\
& =\Delta_{\mathfrak{a}}\left(E^{(1)} \cdot\left(u^{(2)}\right)^{-1}\right)^{-1} \cdot \tilde{J}_{r_{\hbar}} \cdot\left(\left(E^{(1)} \cdot\left(u^{(2)}\right)^{-1}\right) \otimes\left(E^{(1)} \cdot\left(u^{(2)}\right)^{-1}\right)\right),
\end{aligned}
$$

i.e., the element $E^{(2)}=E^{(1)} \cdot\left(u^{(2)}\right)^{-1} \in \mathcal{U} \mathfrak{a}[[\hbar]]$ defines an equivalence between $\tilde{J}_{r_{\hbar}}$ and $\tilde{J}_{r_{\hbar}^{(2)}}$ at any order, and we may compute the first terms of $E^{(2)}$ :

$$
E^{(2)}=1+\left(E_{1}^{(1)}-E_{1}^{(1)}\right) \hbar+E_{2}^{(2)} \hbar^{2}+\cdots=1+0 \hbar+E_{2}^{(2)} \hbar^{2}+\cdots .
$$

Since $r_{t}^{(2)}=r_{1}+r_{2} t+r_{3}^{(2)} t^{2}+\ldots$ and $r_{t}=r_{1}+r_{2} t+r_{3} t^{2}+\ldots$, we have

$$
\left(\tilde{J}_{r_{\hbar}^{(2)}}\right)_{1}=\left(\tilde{J}_{r_{\hbar}}\right)_{1},\left(\tilde{J}_{r_{\hbar}^{(2)}}\right)_{2}=\left(\tilde{J}_{r_{\hbar}}\right)_{2} \text { and }\left(\tilde{J}_{r_{\hbar}^{(2)}}\right)_{3}-\left(\tilde{J}_{r_{\hbar}}\right)_{3}=\frac{1}{2}\left(r_{3}^{(2)}-r_{3}\right) .
$$

But $\tilde{J}_{r_{\hbar}}$ and $\tilde{J}_{r_{\hbar}^{(2)}}$ are equivalent. So, they are equivalent at order 2. This means that there exists an element $E_{2}^{(2)} \in \mathcal{U} \mathfrak{a}$ such that

$$
\left(\tilde{J}_{r_{\hbar}^{(2)}}\right)_{2}-\left(\tilde{J}_{r_{\hbar}}\right)_{2}+G_{2}\left(E_{1}^{(2)},\left(\tilde{J}_{r_{\hbar}^{(2)}}\right)_{1},\left(\tilde{J}_{r_{\hbar}}\right)_{1}\right)=d_{H} E_{2}^{(2)} .
$$

Since $E_{1}^{(2)}=0$, we have $G_{2}\left(E_{1}^{(2)},\left(\tilde{J}_{r_{\hbar}^{(2)}}\right)_{1},\left(\tilde{J}_{r_{\hbar}}\right)_{1}\right)=0$ and so $d_{H} E_{2}^{(2)}=0$, which implies that $E_{2}^{(2)}$ belongs to $\mathfrak{a}$.

The equivalence at order 3 means that there exists $E_{3}^{(2)} \in \mathcal{U} \mathfrak{a}$ such that

$$
\begin{equation*}
\left(\tilde{J}_{r_{\hbar}^{(2)}}\right)_{3}-\left(\tilde{J}_{r_{\hbar}}\right)_{3}+G_{3}\left(E_{1}^{(2)}, E_{2}^{(2)},\left(\tilde{J}_{r_{\hbar}^{(2)}}\right)_{1},\left(\tilde{J}_{r_{\hbar}}\right)_{1},\left(\tilde{J}_{r_{\hbar}^{(2)}}\right)_{2},\left(\tilde{J}_{r_{\hbar}}\right)_{2}\right)=d_{H} E_{3}^{(2)} \tag{6.15}
\end{equation*}
$$

Since $E_{1}^{(2)}=0$ and $\left(\tilde{J}_{r_{\hbar}^{(2)}}\right)_{1}=\left(\tilde{J}_{r_{\hbar}}\right)_{1}$, we obtain

$$
\begin{aligned}
& G_{3}\left(E_{1}^{(2)}, E_{2}^{(2)},\left(\tilde{J}_{r_{\hbar}^{(2)}}\right)_{1},\left(\tilde{J}_{r_{\hbar}}\right)_{1},\left(\tilde{J}_{r_{\hbar}^{(2)}}\right)_{2},\left(\tilde{J}_{r_{\hbar}}\right)_{2}\right)= \\
& \quad=\Delta_{\mathfrak{a}}\left(E_{2}^{(2)}\right) \cdot\left(\tilde{J}_{r_{\hbar}}\right)_{1}-\left(\tilde{J}_{r_{\hbar}}\right)_{1} \cdot\left(1 \otimes E_{2}^{(2)}\right)-\left(\tilde{J}_{r_{\hbar}}\right)_{1} \cdot\left(E_{2}^{(2)} \otimes 1\right) .
\end{aligned}
$$

The skew-symmetric part of this element is

$$
A G_{3}\left(E_{1}^{(2)}, E_{2}^{(2)},\left(\tilde{J}_{r_{\hbar}^{(2)}}\right)_{1},\left(\tilde{J}_{r_{\hbar}}\right)_{1},\left(\tilde{J}_{r_{\hbar}^{(2)}}\right)_{2},\left(\tilde{J}_{r_{\hbar}}\right)_{2}\right)=-\frac{1}{2} d_{P}^{r_{1}} E_{2}^{(2)} .
$$

The equality of the skew-symmetric parts of both sides of (6.15) leads to

$$
r_{3}^{(2)}=r_{3}+d_{P}^{r_{1}} E_{2}^{(2)}
$$

Thus,

$$
\beta_{3}^{\prime}-\beta_{3}=\beta_{3}^{(2)}-\beta_{3}=-\mu_{r_{1}}\left(r_{3}^{(2)}-r_{3}\right)=-\mu_{r_{1}}\left(d_{P}^{r_{1}} E_{2}^{(2)}\right)=d_{c}\left(\mu_{r_{1}}\left(E_{2}^{(2)}\right)\right)
$$

This means that there exists a 1-cochain $\alpha_{2}=\mu_{r_{1}}\left(E_{2}^{(2)}\right)$ such that

$$
\beta_{3}^{\prime}=\beta_{3}+d_{c} \alpha_{2} .
$$

Using the induction hypothesis, and following the same steps, we conclude the proof.

Combining the last two theorems we obtain the following result, similar in Etingof-Kazhdan quantization theory to the one by Drinfeld in [5].

Theorem 6.11. Let $\tilde{J}_{r_{\hbar}}$ and $\tilde{J}_{r_{\hbar}^{\prime}}$ be as in a) Theorem 6.8. Then, $\tilde{J}_{r_{\hbar}}$ and $\tilde{J}_{r_{\hbar}^{\prime}}$ are equivalent ISP if, and only if, $\beta_{\hbar}$ and $\beta_{\hbar}^{\prime}$ belong to the same formal cohomological class. In other words, $\tilde{J}_{r_{\hbar}}$ and $\tilde{J}_{r_{\hbar}^{\prime}}$ are equivalent ISP if, and only if, there exists a formal 1-cochain $\alpha_{\hbar}=\alpha_{1} \hbar+\alpha_{2} \hbar^{2}+\ldots$ such that $\beta_{\hbar}^{\prime}=\beta_{\hbar}+d_{c} \alpha_{\hbar}$.

Theorem 6.11 and Remark 2) in page 841 of [7] allow us to obtain
Theorem 6.12. Two triangular Hopf QUE-algebras $A_{\mathfrak{a}[\hbar \hbar], \tilde{T}_{r_{\hbar}^{1}}^{-1}}$ and $A_{\mathfrak{a}[\hbar \hbar],, \tilde{T}_{r_{\hbar}^{\prime}}^{-1}}$ are isomorphic if, and only if, there exists an isomorphism of Lie algebras $\lambda: \mathfrak{a}[[\hbar]] \longrightarrow \mathfrak{a}[[\hbar]]$ over $M R[[\hbar]]$ such that $\left(\lambda^{2} \otimes \lambda^{2}\right) \beta_{\hbar}$ and $\beta_{\hbar}^{\prime}$ belong to the same cohomological class where $\beta_{\hbar}=\mu_{r_{\hbar}}\left(r_{\hbar}\right), \beta_{\hbar}^{\prime}=\mu_{r_{\hbar}^{\prime}}\left(r_{\hbar}^{\prime}\right)$ and $\lambda^{2}=\left(\lambda^{-1}\right)^{\mathrm{t}}$.

## Proof:

If the pair $(\lambda, u)$ defines an isomorphism between the triangular Hopf QUE algebras (see proposition 3.9 in [6]), in particular, the map $\operatorname{Ad}(u) \circ \tilde{\lambda}$ satisfies the following equality

$$
(A d(u) \circ \tilde{\lambda}) \otimes(A d(u) \circ \tilde{\lambda}) R^{r_{\hbar}}=R^{r_{\hbar}^{\prime}} .
$$

We know that $R^{r_{\hbar}}=1+r_{1} \hbar+O\left(\hbar^{2}\right)$ and $R^{r^{\prime}}=1+r_{1} \hbar+O\left(\hbar^{2}\right)$. Computing the coefficients of $\hbar$ at both sides of last equality, we obtain

$$
(\lambda \otimes \lambda) r_{1}=r_{1} \bmod \hbar .
$$

So, $(\lambda \otimes \lambda)\left(r_{\hbar}\right)=r_{1}+r_{2}^{\prime \prime} \hbar+r_{3}^{\prime \prime} \hbar^{2}+\cdots$. Denote this element by $r_{\hbar}^{\prime \prime}$ (it is also a solution of CYBE). We know also that

$$
\begin{equation*}
\tilde{J}_{r_{\hbar}^{\prime}}^{-1}=(u \otimes u) \cdot(\tilde{\lambda} \otimes \tilde{\lambda})\left(\tilde{J}_{r_{\hbar}}^{-1}\right) \cdot \Delta_{\mathfrak{a}}(u)^{-1} \tag{6.16}
\end{equation*}
$$

Consider the invariant star product $\tilde{J}_{r_{\hbar}^{\prime \prime}}$ defined through the $E-K$ quantization. By proposition 6.6, since $(\lambda \otimes \lambda)\left(r_{\hbar}\right)=r_{\hbar}^{\prime \prime}$, we have

$$
\left(\lambda, \lambda^{2}\right)^{\otimes^{2}} J_{r_{\hbar}}=J_{r_{\hbar}^{\prime \prime}},
$$

where $\lambda^{2}=\left(\lambda^{-1}\right)^{\mathfrak{t}}$. Using proposition 6.7, we obtain

$$
(\tilde{\lambda} \otimes \tilde{\lambda}) \tilde{J}_{r_{\hbar}}=\tilde{J}_{r_{\hbar}^{\prime \prime}} .
$$

Taking inverses at both sides of (6.16), we obtain

$$
\begin{aligned}
\tilde{J}_{r_{\hbar}^{\prime}} & =\Delta_{\mathfrak{a}}(u) \cdot(\tilde{\lambda} \otimes \tilde{\lambda})\left(\tilde{J}_{r_{\hbar}}\right) \cdot\left(u^{-1} \otimes u^{-1}\right) \\
& =\Delta_{\mathfrak{a}}(u) \cdot \tilde{J}_{r_{\hbar}^{\prime \prime}} \cdot\left(u^{-1} \otimes u^{-1}\right) .
\end{aligned}
$$

This means that $\tilde{J}_{r_{\hbar}^{\prime}}$ and $\tilde{J}_{r_{n}^{\prime \prime}}$ are equivalent star products. By theorem 6.10, $\beta_{\hbar}^{\prime}=\mu_{r_{\hbar}^{\prime}}\left(r_{\hbar}^{\prime}\right)$ and $\beta_{\hbar}^{\prime \prime}=\mu_{r_{\hbar}^{\prime \prime}}\left(r_{\hbar}^{\prime \prime}\right)$ belong to the same formal cohomological class. Since $(\lambda \otimes \lambda) r_{\hbar}=r_{\hbar}^{\prime \prime}$, by proposition 6.2, we get $\beta_{\hbar}^{\prime \prime}=\left(\lambda^{-1}\right)^{\mathfrak{t}} \otimes\left(\lambda^{-1}\right)^{\mathfrak{t}} \beta_{\hbar}=$ $\left(\lambda^{2} \otimes \lambda^{2}\right) \beta_{\hbar}$ and we conclude that $\beta_{\hbar}^{\prime}$ and $\left(\lambda^{2} \otimes \lambda^{2}\right) \beta_{\hbar}$ belong to the same formal cohomological class.

If $\left(\left(\varphi^{1}\right)^{-1}\right)^{\mathfrak{t}} \otimes\left(\left(\varphi^{1}\right)^{-1}\right)^{\mathfrak{t}} \beta_{\hbar}=\beta_{\hbar}^{\prime \prime}$ and $\beta_{\hbar}^{\prime}$ belong to the same cohomological class, then, by theorem 6.8, $\tilde{J}_{r_{\hbar}^{\prime \prime}}$ and $\tilde{J}_{r_{\hbar}^{\prime}}^{\prime}$ are equivalent star products, where $r_{\hbar}^{\prime \prime}=\mu_{r_{\hbar}^{\prime \prime}}^{-1}\left(\beta_{\hbar}^{\prime \prime}\right)$. This means that there exists an element $u \in \mathcal{U} \mathfrak{a}[[\hbar]], u \equiv$ $1 \bmod \hbar$, such that

$$
\tilde{J}_{r_{\hbar}^{\prime}}=\Delta_{\mathfrak{a}}(u)^{-1} \cdot \tilde{J}_{r_{\hbar}^{\prime \prime}} \cdot(u \otimes u),
$$

equivalent also to

$$
\begin{equation*}
\tilde{J}_{r_{\hbar}^{\prime}}^{-1}=\left(u^{-1} \otimes u^{-1}\right) \cdot \tilde{J}_{r_{\hbar}^{\prime \prime}}^{-1} \cdot \Delta_{\mathfrak{a}}(u) . \tag{6.17}
\end{equation*}
$$

Since $\left(\varphi^{1} \otimes \varphi^{1}\right) r_{\hbar}=r_{\hbar}^{\prime \prime}$ (see proposition 6.2), we have, by propositions 6.6 and 6.7,

$$
\tilde{J}_{r_{\hbar}^{\prime \prime}}=\left(\tilde{\varphi}^{1} \otimes \tilde{\varphi}^{1}\right) \tilde{J}_{r_{\hbar}} .
$$

Substituting this in (6.17), we obtain

$$
\tilde{J}_{r_{\hbar}^{\prime}}^{-1}=\left(u^{-1} \otimes u^{-1}\right) \cdot\left(\tilde{\varphi}^{1} \otimes \tilde{\varphi}^{1}\right)\left(\tilde{J}_{r_{\hbar}}^{-1}\right) \cdot \Delta_{\mathfrak{a}}(u) .
$$

Considering $\lambda_{1}=\varphi^{1}$ and $u_{1}=u^{-1}$, the pair $\left(\lambda_{1}, u_{1}\right)$ defines an isomorphism between $A_{\mathfrak{a}[[\hbar]], \tilde{J}_{\hbar}^{-1}}$ and $A_{\mathfrak{a}[\hbar \hbar], \tilde{J}_{\tau_{\hbar}^{\prime}}^{-1}}$ (see proposition 3.9 in [6]).
5) From the above results and Remark 2) in page 841 of [7] we may also prove :
Proposition 6.13. Let $A_{\mathfrak{a} \oplus \mathfrak{a}_{r_{h}}^{*}, \Omega, J_{r_{h}}^{-1}}$ and $A_{\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}^{\prime}}^{*}, \Omega, J, J_{\hbar}^{\prime-}}$ be quasitriangular Hopf QUE algebras over $\mathbb{R}[[\hbar]]$ which are quantizations, as in theorem 4.7, of the quasitriangular Lie bialgebra $\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{1}}^{*},[,]_{\mathfrak{a} \oplus \mathfrak{a}_{r_{1}}^{*}}, \varepsilon_{\mathfrak{a}_{\oplus} \mathfrak{a}_{r_{1}}^{*}}=d_{c} r\right)$. Let $\beta_{\hbar}=$ $\mu_{r_{\hbar}}\left(r_{\hbar}\right)=\beta_{1}+\beta_{2} \hbar+\ldots$ and $\beta_{\hbar}^{\prime}=\mu_{r_{\hbar}^{\prime}}\left(r_{\hbar}^{\prime}\right)=\beta_{1}+\beta_{2}^{\prime} \hbar+\ldots$ If $\beta_{\hbar}$ and $\beta_{\hbar}^{\prime}$
 isomorphic.

## Proof:

If $\beta_{t}$ and $\beta_{t}^{\prime}$ belong to the same cohomological class, by theorem 6.4, there exists a unique element $X_{t}=X_{1}+X_{2} t+\cdots \in \mathfrak{a}$, such that

$$
\exp \left(a d_{t X_{t}}^{*}\right)^{\otimes^{2}} \beta_{t}=\beta_{t}^{\prime} .
$$

Using proposition 6.2 with $\varphi_{t}^{2}=\exp \left(a d_{t X_{t}}^{*}\right)$, there exists an isomorphism $\varphi_{t}^{1}=\left(\left(\varphi_{t}^{2}\right)^{\mathfrak{t}}\right)^{-1}: \mathfrak{a} \longrightarrow \mathfrak{a}$ of Lie algebras such that $\left(\varphi_{t}^{1} \otimes \varphi_{t}^{1}\right) r_{t}=r_{t}^{\prime}$. By proposition 6.1, this pair $\left(\varphi_{t}^{1} ; \varphi_{t}^{2}\right)$ defines an isomorphism from the Lie bialgebra $\mathfrak{a} \oplus \mathfrak{a}_{r_{t}}^{*}$ to the Lie bialgebra $\mathfrak{a} \oplus \mathfrak{a}_{r_{t}^{\prime}}^{*}$ and sends the canonical element $r$ of the vector space $\left(\mathfrak{a} \oplus \mathfrak{a}^{*}\right)^{\otimes^{2}}$ to itself. Thus, $\left(\varphi_{t}^{1} ; \varphi_{t}^{2}\right)$ also will send $\Omega$ into $\Omega$, where $\Omega=r_{12}+r_{21}$. Applying now proposition 6.6, we have

$$
J_{r_{t}^{\prime}}=\left(\tilde{\varphi}_{t}^{1} ; \tilde{\varphi}_{t}^{2}\right)^{\otimes^{2}} J_{r_{t}},
$$

where $\tilde{\varphi}_{t}^{1}$ and $\tilde{\varphi}_{t}^{2}$ are extensions of $\varphi_{t}^{1}$ and $\varphi_{t}^{2}$ to homomorphisms $\mathcal{U a}[[\hbar]] \longrightarrow$ $\mathcal{U} \mathfrak{a}[[\hbar]]$ and $\mathcal{U}_{r_{t}}^{*}[[\hbar]] \longrightarrow \mathcal{U}_{r_{t}^{\prime}}^{*}[[\hbar]]$, respectively. Putting $t=\hbar$ it is clear
that $\left(\varphi_{\hbar}^{1}, \varphi_{\hbar}^{2}\right)$ defines an isomorphism $\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}}^{*} \longrightarrow \mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}^{\prime}}^{*}$ and the elements $J_{r_{\hbar}^{\prime}}=\left.J_{r_{t}^{\prime}}\right|_{t=\hbar}, J_{r_{\hbar}}=\left.J_{r_{t}}\right|_{t=\hbar}$. We obtain the equality

$$
J_{r_{\hbar}^{\prime}}=\left(\tilde{\varphi}_{\hbar}^{1} ; \tilde{\varphi}_{\hbar}^{2}\right)^{\otimes^{2}} J_{r_{\hbar}}
$$

Using an analogous proposition to proposition 3.9 in [6] with $\lambda=\left(\varphi_{\hbar}^{1} ; \varphi_{\hbar}^{2}\right)$ and $u=1$, we conclude that the map

$$
\left.\widetilde{\left(\varphi_{\hbar}^{1} ; \varphi_{\hbar}^{2}\right.}\right)=\left(\tilde{\varphi}_{\hbar}^{1} ; \tilde{\varphi}_{\hbar}^{2}\right): \hat{\mathcal{U}}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}}^{*}\right) \longrightarrow \hat{\mathcal{U}}\left(\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}^{\prime}}^{*}\right)
$$

is an isomorphism $A_{\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}}^{*}, \Omega, J_{r_{\hbar}^{\prime}}^{-1}} \longrightarrow A_{\mathfrak{a} \oplus \mathfrak{a}_{r_{\hbar}^{*}}^{*}, \Omega, J_{r_{\hbar}^{\prime}}^{-1}}$.
About the converse of this proposition, we have [22] some examples of isomorphisms where $\left[\beta_{\hbar}\right] \neq\left[\beta_{\hbar}^{\prime}\right]$.
