The role of Meta-analysis in Pharmacovigilance: how best to combine different sources of evidence about harms?

Tese de doutoramento em Ciências Farmacêuticas, especialidade de Farmácia Clínica, orientada pela Professora Doutora Ana Filipa Pereira Amaral de Macedo e pelo Professor Doutor Francisco Jorge Batel Marques e apresentada à Faculdade de Farmácia da Universidade de Coimbra

All the research work presented in this thesis was performed in strict collaboration of the Health Sciences Research Centre, Faculty of Health Sciences, University of Beira Interior, the Laboratory of Pharmacology, Faculty of Pharmacy, University of Coimbra and the Centre for Health Technology Assessment and Drug Research, Association for Innovation and Biomedical Research on Light and Image, under the supervision of Professor Francisco Jorge Batel Marques and Professor Ana Filipa Pereira Amaral de Macedo and funded by Portuguese Foundation for Science and Technology (SFRH/BD/64957/2009).

Todos os trabalhos experimentais apresentados nesta tese foram realizados em estreita colaboração entre o Centro de Investigação em Ciências da Saúde da Faculdade de Ciências da Saúde da Universidade da Beira Interior, o Laboratório de Farmacologia da Faculdade de Farmácia da Universidade de Coimbra e o Centro de Avaliação de Tecnologias em Saúde e Investigação do Medicamento da Associação para Investigação Biomédica e Inovação em Luz e Imagem, sob a supervisão da Professora Doutora Ana Filipa Pereira Amaral de Macedo e do Professor Doutor Francisco Jorge Batel Marques, e com o apoio financeiro da Fundação para a Ciência e a Tecnologia (SFRH/BD/64957/2009).

Aos meus avós.

#### AGRADECIMENTOS

A ambos os meus orientadores, Professora Doutora Ana Filipa Macedo e Professor Doutor Francisco Batel Marques, agradeço pela orientação científica, disponibilidade, profissionalismo e humanismo. Agradeço também o convite que me endereçaram durante para realizar este trabalho. O facto de ambos nunca deixarem de acreditar no nosso trabalho levou-o a bom porto.

Um agradecimento especial ao Professor Doutor Francisco Batel Marques. Por me integrar como colaborador da Unidade de Farmacovigilância do Centro (UFC) e do Centro de Avaliação de Tecnologias em Saúde e Desenvolvimento do Medicamento (CHAD), da AIBILI – Associação para a Investigação Biomédica e Inovação em Luz e Imagem. Esta interação acrescentou um enorme valor a este trabalho. E pelo seu companheirismo e confiança pessoal.

À AIBILI – Associação para a Investigação Biomédica e Inovação em Luz e Imagem por me ter apoiado incondicionalmente nos meus trabalhos. É uma honra colaborar com uma instituição com o reconhecimento científico internacional como o da AIBILI.

Ao Centro de Investigação em Ciências da Saúde (CICS), da Universidade da Beira Interior, por me ter acolhido durante a execução dos trabalhos.

À Faculdade de Farmácia da Universidade de Coimbra por me ter proporcionado condições para conduzir este trabalho.

À Dra. Zilda Mendes, do Centro de Estudos de Avaliação em Saúde (CEFAR) da Associação Nacional das Farmácias (ANF), pela sua introdução à meta-análise e pelo seu cuidado em acompanhar-me inicialmente.

Ao Dr. Diogo Mendes, da UFC, pela sua ajuda, pela análise crítica e companheirismo.

E à minha família.

ABSTRACT/RESUMO

#### ABSTRACT

The assessment of the benefit/risk relation is conducted throughout the entire drug life cycle. Before a market authorization is granted, randomized clinical trials are designed to evaluate the efficacy and safety of a drug in a specific therapeutic indication. These studies are able to detect the most frequent adverse events. However, rare and/or long-latency harmful events are usually detected after a drug becomes available in the market. The increased seriousness of some adverse events may lead to label update with warnings or even to a drug withdrawal after being marketed for some years. Post-marketing observational studies may better reflect the nature of adverse events occurring in clinical practice since they include populations usually underrepresented in clinical trials, such as the elderly, pregnant women or patients with comorbidities.

The investigation of uncommon or long-term adverse events associated with pharmacological interventions has been discussed as a potential important application of meta-analysis. Meta-analysis is a systematic approach to synthesize and combine the results of selected studies. It is used to identify sources of variation among study findings and to provide an overall measure of effect to reach conclusions about a body of research. The meta-analytic technique has been applied with increasing frequency to clinical trials when efficacy assessments are needed. Although not frequently, meta-analysis conducted for safety purposes have also found increased risk estimates associated with some drugs, such cardiovascular adverse events due to rosiglitazone.

This project carried out in order to identify the role of meta-analysis as a Pharmacovigilance approach and to evaluate how best to combine safety information from both experimental and observational studies through this statistical technique. Only a limited number of meta-analyses are currently devoted to evaluate drug safety as a primary outcome. Of these, very few combine data from both observational and experimental studies. Although statistical significant risk estimates could be reached with the inclusion of observational studies in meta-analysis, isolated or in combination with clinical trials, the increased between-studies heterogeneity usually associated may preclude any definitive conclusions.

Authorities do not rely solely on risk estimates produced by meta-analysis and usually review additional sources of information to support benefit/risk ratio reevaluations due to safety issues. It was also demonstrated that cumulative meta-analysis was able to estimates increased iatrogenic risks years earlier than regulatory decisions have been taken by

33

authorities for the corresponding safety issues. However, excessive heterogeneity resulting from different study designs included in these set of meta-analyses may be one of the reasons delaying the acceptance of this technique by regulatory authorities when evaluating medicines safety profile.

Although reliable risk estimates have shown to be produced from meta-analyses conducted to evaluate drug safety issues, between-studies heterogeneity may not let drawing robust conclusions from those results, in particular when observational studies are included. The results of this work do not let recommend that a meta-analysis of the existing evidence should be conducted whenever a safety alert is issued. Moreover, this technique does not replace further assessments when the benefit/risk ratio profile of a medicine needs to be revised due to safety issues.

### RESUMO

A relação benefício/risco de um medicamento é avaliada durante todo o seu ciclo de vida. Antes de ser concedida a autorização de introdução no mercado, a eficácia e a segurança de um medicamento numa determinada indicação terapêutica são avaliadas através da condução de ensaios clínicos aleatorizados e controlados. Estes estudos são capazes de identificar a maioria dos eventos adversos associados ao tratamento com um medicamento. No entanto, após a introdução no mercado, eventos adversos raros e/ou de longo tempo de latência podem ocorrer durante o tratamento com um determinado medicamento, sem que antes tenham sido identificados durante o desenvolvimento clínico. Os estudos observacionais pós-comercialização permitem identificar eventos adversos pode levar à inclusão de uma advertência no resumo das características do medicamento ou até mesmo à sua retirada do mercado. Os estudos observacionais pós-comercialização podem refletir melhor a natureza dos eventos adversos que ocorrem durante a prática clínica, uma vez que estes estudos permitem avaliar subpopulações de doentes que não são frequentemente incluídas nos ensaios clínicos, como os idosos, as grávidas ou as crianças.

A investigação do risco de ocorrência de eventos adversos raros e/ou de longo tempo de latência associados ao tratamento com intervenções farmacológicas tem vindo a ser discutida como uma potencial aplicação da meta-análise. A meta-análise é uma ferramenta estatística que permite sintetizar e combinar resultados de vários estudos. É utilizada para identificar causas para a variação dos resultados entre os estudos e permite obter uma medida de efeito. A meta-análise tem sido aplicada frequentemente a ensaios clínicos com o objetivo de conduzir avaliações da eficácia das intervenções. Embora menos frequentemente, também têm sido conduzidas meta-análises de segurança que em alguns casos identificaram riscos acrescidos para eventos adversos, como o risco acrescido de eventos cardiovasculares associado à rosiglitazona.

Este projeto foi conduzido com o objetivo de identificar o papel da meta-análise na Farmacovigilância e para avaliar como combinar diferentes fontes de informação sobre segurança, nomeadamente estudos experimentais e observacionais, através da técnica metaanalítica. Apenas uma pequena proporção das meta-análises conduzidas atualmente considera a segurança como marcador primário. Destas, muito poucas combinam informação de estudos experimentais e estudos observacionais. Apesar das meta-análises que integram informação de estudos observacionais, de forma exclusiva ou em combinação

com estudos experimentais, poderem produzir estimativas de risco estatisticamente significativas, a elevada heterogeneidade que normalmente lhes está associada não permite que se tirem conclusões definitivas com base nesses resultados.

As autoridades reguladoras não baseiam as suas decisões apenas nos resultados produzidos pelas meta-análises quando pretendem conduzir reavaliações da relação benefício/risco dos medicamentos devido a questões de segurança, e têm em conta a informação gerada por outros estudos. Os resultados obtidos durante este trabalho demonstraram também que a integração cumulativa dos resultados de vários estudos através da meta-análise permitiu estimar riscos acrescidos para o desenvolvimento de eventos adversos associados a medicamentos para os quais as autoridades tomaram decisões regulamentares posteriormente à data em que se alcançou essa estimativa. No entanto, a excessiva heterogeneidade que resultou da inclusão de estudos com diferentes delineamentos nestas meta-análises pode ter sido uma das razões que tem impedido uma melhor aceitação desta técnica pelas autoridades reguladoras.

Apesar de a meta-análise poder produzir estimativas de risco fiáveis quando se avaliar a segurança de medicamentos, a heterogeneidade excessiva que se verifica em alguns casos pode impedir os investigadores e as autoridades reguladoras de avaliar corretamente a relação causa-efeito entre a exposição ao medicamento e o evento adverso, particularmente quando se incluiem estudos observacionais. Os resultados deste trabalho não permitem recomendar que se conduza uma meta-análise sempre que ocorra um alerta de segurança. Desta forma, a meta-análise não substitui outras fontes de informação quando a relação benefício/risco dos medicamentos necessita de ser reavaliada devido a questões de segurança.

# **CHAPTER I – GENERAL INTRODUCTION**

# I.I. INCIDENCE OF ADVERSE DRUG REACTIONS AND ITS IMPACT ON PUBLIC HEALTH

The effect of medical innovation over the last century is undeniable. Although pharmacological alternatives have been developed to effectively treat severe diseases, medicines can also cause iatrogenic effects. An adverse event (AE) is defined as any noxious and unintended occurrence that may present during treatment with a drug but which does not necessarily have a causal relationship with this treatment (EUROPEAN MEDICINE AGENCY, 2013). This can be through the use of the drug in its approved conditions but also as a result of misuse (situations where the medicinal product is intentionally and inappropriately used not in accordance with the authorised product information), abuse (persistent or sporadic, intentional excessive use of medicinal products which is accompanied by harmful physical or psychological effects) or medication error (EUROPEAN MEDICINE AGENCY, 2013). An adverse drug reaction (ADR) is characterized by the suspicion of a causal association between the exposure to a drug and the occurrence of an adverse event, i.e. judged possible by the reporter or an established causal assessment method (LINDQUIST, 2007).

A survey conducted in noninstitutionalized adults in the United States of America (USA) estimated that more than 90% of the population aged 65 years or older takes at least one medication per week (KAUFMAN *et al.*, 2002). Around 50% of the study' population reported receiving treatment with at least one prescription medicine (KAUFMAN *et al.*, 2002). All medicines can cause unwanted effects, which incidence is expected to increase along with its widespread use. From 1998 through 2005, reported serious adverse drug events in the USA increased 2.6-fold from 34 966 to 89 842, and fatal adverse drug events increased 2.7-fold from 5519 to 15 107 (MOORE, COHEN, and FURBERG, 2007). Notoriously, during the same time period, the overall relative increase of serious AEs reporting was 4 times faster than the growth in total US outpatient prescriptions, which grew in the same period from 2.7 billion to 3.8 billion (MOORE, COHEN, and FURBERG, 2007).

Adverse drug reactions have a significant impact on public health, accounting for considerable morbidity and mortality (GANDHI *et al.*, 2003). Several studies were dedicated to characterize the incidence and the impact of iatrogenic medication disease. For patients receiving treatment in the ambulatory care, the average incidence of AEs is estimated to range from 4 to 91 per 1,000 person-months (THOMSEN *et al.*, 2007). Almost 5% of total

hospital admissions are due to AEs, but in the elderly population this proportion is estimated to be 16.6% (BEIJER and DE BLAEY, 2002). A meta-analysis conducted by Lazarou and colleagues (1998) estimated the overall incidence of serious ADRs as being 6.7% and fatal adverse drug reactions as being 0.32%. Other studies conducted in the hospital setting estimated that 4 to 5% of the inpatients suffered AEs and that fatal AEs have been reported in 0.05 to 0.95% of inpatients. (LEENDERTSE *et al.*, 2010; KANJANARAT *et al.*, 2003; EBBESEN *et al.*, 2001; JUNTTI-PATINEN, and NEUVONEN, 2002).

Additional costs from drug-related morbidity represent a considerable proportion of total costs of health care systems. A study conducted in Sweden estimated the proportions of patients with drug-related morbidity (DRM) and preventable DRM and the cost-of-illness (COI) of DRM in Sweden based on pharmacists 'expert opinion (GYLLENSTEN et al., 2012). It was estimated that the cost-of-illness for treating patients attending healthcare services due to drug-related morbidity would cost 997€ per patient, corresponding to an annual cost of 6.600 million euros to the Swedish healthcare system. In Germany, direct costs of ADRs were estimated as being 3.814€ per patient (STARK, JOHN and LEIDL, 2011).

# I.2. BRIEF HISTORICAL BACKGROUND OF DRUG SAFETY AND DRUG SAFETY MONITORING

Pharmacological treatments are perhaps as old as mankind and their iatrogenic events have been reported in literature for many years, in both anecdotal and scientific ways (RÄGGO and SANTOSO, 2008). Drug regulation, in particular regulation for drug safety and for drug safety monitoring, has been impelled upon misfortunate events rather than a rational and knowledge based development (RÄGGO and SANTOSO, 2008).

The USA government established the Bureau of Drugs in order to implement the Biologics Control Act of 1902 (AHMAD, MARKS and GOETSCH, 2006). In early XX century, antitoxin derived from the blood of tetanus-infected retired horses was used to treat diphtheria patients. By 1901, however, in St. Louis, Missouri, 13 children who had been given diphtheria antitoxin died of tetanus (US FOOD AND DRUG ADMINISTRATION, 2009a). The second incident occurred in New Jersey when nine children died from contaminated smallpox vaccine (US FOOD AND DRUG ADMINISTRATION, 2009b). The 1902 Act enacted by the US Congress required annual licensing of manufacturers and distributors and the labelling of all products with the name of the manufacturer (AHMAD, MARKS and GOETSCH, 2006).

In 1906, the original Food and Drugs Act is passed by the US Congress and signed by the president Theodore Roosevelt, prohibiting interstate commerce in misbranded and adulterated foods, drinks and drugs (US FOOD AND DRUG ADMINISTRATION, 2009c). At this time, neither the efficacy nor the pre- and pro-marketing safety of medicines was regulated. It was only in the 1930s that drug safety started be regulated and again due to a disaster.

The S.E. Massengill Co. introduced a sulphanilamide flavoured elixir containing diethylene glycol, an antifreeze. Although the toxic effects of diethylene glycol have been documented 1931 it did not avoid the death of more than 100 people by 1937 (AHMAD, MARKS and GOETSCH, 2006). The Federal Food, Drug and Cosmetic Act was passed by the US Congress in June 1938, requiring that new drugs should be submitted for safety tests before marketing, with the results being submitted to the FDA (AHMAD, MARKS and GOETSCH, 2006). Additionally, this law says that sulphanilamide and other selected dangerous drugs must be administrated under the direction of a qualified person, thus launching the requirement for prescription only (non-narcotic) drugs (US FOOD AND DRUG ADMINISTRATION, 2009c).

Little attention was paid to ADRs until the 1950s when, partially impelled by the developments conducted during the Second World War, pharmaceutical industry experienced an expansion and an increase number of new launched products (AHMAD, MARKS and GOETSCH, 2006). Chloramphenicol was approved in 1949 as a broad-spectrum antibiotic. In 1952 an investigation conducted by FDA revealed that chloramphenicol had caused nearly 180 cases of fatal blood diseases, such as fatal aplastic anaemia (US FOOD AND DRUG ADMINISTRATION, 2009c). In order to gather data to investigate this safety issue, FDA ordered the staff in all 16 district offices to contact every hospital, medical school, and clinic in cities with populations of at least 100.000 to collect information on any cases of blood dyscrasias associated with chloramphenicol (AHMAD, MARKS and GOETSCH, 2006). In few days, 217 cases of chloramphenicol-associated blood dyscrasias were identified (AHMAD, MARKS and GOETSCH, 2006). The result of this experience, coupled with the need to identify serious AEs, as quickly as possible, led the American Medical Association to establish a Committee on Blood Dyscrasias which collected case reports of drug-induced blood related illness (AHMAD, MARKS and GOETSCH, 2006). In 1956, the American Society of Hospital Pharmacists, the American Association of Medical Record Librarians and the American Medical Association piloted the first US drug ADR surveillance program (US FOOD AND DRUG ADMINISTRATION, 2009c). This program began with six hospitals and by 1965 had grown to over 200 teaching hospitals reporting to FDA in a monthly basis.

In the district of Castelo Branco, Portugal, several children died after receiving treatment with an antibiotic during 1957 (CABRITA DA SILVA, SOARES and MARTINS, 2012). This event led the Portuguese authorities to pass the Decree law n° 41448/57, demanding a previous evaluation of new medicines before market access authorization could be granted. At that time, this was a pioneering legislation in Europe (CABRITA DA SILVA, SOARES and MARTINS, 2012). Despite the measures, the Portuguese drug safety monitoring system remained practicly inexistent until the country's admission to the European Economic Community, in 1986.

The so called "thalidomide disaster" is the most remarkable case of iatrogenic worldwide. Thalidomide was a mild hypnotic and sedative which was often used to alleviate morning sickness in pregnant women, going on sale for the first time in Western Germany in 1956 and approved in several countries in the following years (RÄGGO and SANTOSO, 2008). Shortly after thalidomide being approved, it was observed an increase in the frequency of a previously rare birth defect, phocomelia – malformation of limbs (AHMAD, MARKS and GOETSCH, 2006). Dr. William McBride, an Australian physician, reported this adverse drug

reaction for the first time in 1961 (MCBRIDE, 1961). It is estimated that thousands of babies had been exposed to thalidomide during pregnancy. This event led several countries to legislate new regulatory procedures. Although thalidomide was never approved in USA, the US Congress approved the 1962 Kefauver-Harris Amendments to the Food, Drug, and Cosmetic Act of 1938 requiring drug manufacturers to prove to FDA the efficacy and safety of new products before the approval (AHMAD, MARKS and GOETSCH, 2006). Moreover, and for the first time, this law also mandated that pharmaceutical manufacturers must report AEs to FDA for any of their products having a New Drug Application (AHMAD, MARKS and GOETSCH, 2006). The Committee on the Safety of Drugs was established in the United Kingdom (UK) in 1963 and in the following year the Yellow Card Scheme was created allowing physicians to report suspected adverse drug reactions (MEDICINES AND HEALTHCARE PRODUCTS REGULATORY AGENCY, 2013). Other countries like Australia, Canada, Czechoslovakia, Ireland, the Netherlands, New Zealand, Sweden, the United States, and West Germany initiated the systematic collection of cases of suspected adverse drug reactions (EDWARDS et al., 2006).

In 1967, the World Health Assembly of the World Health Organization (WHO) adopted the World Health Assembly (WHA) 20.51 Resolution (Pilot Research Project for International Monitoring of Adverse Reactions to Drugs) which laid the basis for the international system of monitoring ADRs (VENULET and HELLING-BORDA, 2010). The WHO Pilot Research Project for International Drug Monitoring started its operation in Alexandria, Virginia, USA in 1968, with ten countries from Europe, Australasia and North America pooling all reports that had been sent to their national monitoring centres in this WHO project (VENULET and HELLING-BORDA, 2010; EDWARDS et al., 2006). The centre was transferred to the WHO headquarters in Geneva in 1970 before being finally established in Sweden in 1978 as the WHO Uppsala Monitoring Centre (VENULET and HELLING-BORDA, 2010; EDWARDS et al., 2006).

The Portuguese Decree law n° 72/91 adopted the European Union directives, requiring market authorization holders, physicians, pharmacists and other healthcare professionals to report suspected adverse drug reactions to national competent authorities (CABRITA DA SILVA, SOARES and MARTINS, 2012). In 1992, the Normative order n° 107/92 established the Portuguese National Pharmacovigilance System. A year latter the Portuguese national regulatory authority was created under the Decree law n° 353/93 and named *Instituto Nacional da Farmácia e do Medicamento* (INFARMED), now INFARMED - Autoridade Nacional do Medicamento e Produtos de Saúde (CABRITA DA SILVA, SOARES and MARTINS, 2012).

This legislation also established the National Pharmacovigilance Centre, which the main purpose was to continue the implementation of the Portuguese National Pharmacovigilance System (CABRITA DA SILVA, SOARES and MARTINS, 2012).

In 1997 it was developed the Computerized Online Medicaid Analysis and Surveillance System (STROM, 2006a). This system used Medicaid billing data to conduct pharmacoepidemiology studies. In 1980 it was developed what today is called the Drug Safety Research Unit in the UK, which is known for being a pioneer in performing Prescription Event Monitoring studies (STROM, 2006a). Both of these novel approaches gave important contributions in the pharmacovigilance field since investigators have gained new tools to generate and investigate research hypothesis on safety issues.

Until the beginning of the 1990s there were five different forms for manufacturers and health care professionals to report medicines' related problems to FDA (AHMAD, MARKS and GOETSCH, 2006). In 1993, it was launched the FDA's MedWatch Adverse Event Reporting Program aiming to facilitate, support and promote the voluntary reporting of suspected adverse drug reactions by health care professionals and consumers (AHMAD, MARKS and GOETSCH, 2006; US FOOD AND DRUG ADMINISTRATION, 2009c).

The European Agency for the Evaluation of Medicinal Products (EMEA) was established in 1995 as well as a new regulatory system which includes procedures for a centralised authorisation (BAHRI, TSINTIS and WALLER, 2007). The agency created the Pharmacovigilance Working Party (PhVWP) of the Committee for Medicinal Products for Human Use (CHMP) to provide recommendations to the CHMP on all matters relating directly or indirectly to pharmacovigilance (EUROPEAN MEDICINES AGENCY, 2005). Upon request of national authorities, the PhVWP could provide recommendations for noncentrally authorised medicines (EUROPEAN MEDICINES AGENCY, 2005). The European Union (EU) pharmacovigilance system was created to supervise the safety of the medicines on the European market. In 2004 EMEA changed its designation to European Medicines Agency (EMA).

The FDA announces the Drug Safety Board, consisting of FDA staff and representatives from the National Institutes of Health and the Veterans Administration (US FOOD AND DRUG ADMINISTRATION, 2009c). This board will advise the Director, Centre for Drug Evaluation and Research (CDER), FDA, on drug safety issues and work with the agency in communicating safety information to health professionals and patients (US FOOD AND DRUG ADMINISTRATION, 2009c).

In 2010, the European Commission reviewed the EU pharmacovigilance system and proposed new legislation (EUROPEAN MEDICINES AGENCY, 2013). This new legislation entered in to force in 2012. Over the years, several EU Member States established schemes for patients directly to report suspected adverse drug reactions to healthcare authorities. The recently implemented EU pharmacovigilance legislation introduced the legal right for European citizens to report suspected adverse drug reaction (EUROPEAN MEDICINES AGENCY, 2013). The Pharmacovigilance Risk Assessment Committee (PRAC) was created and it will meet monthly. The PRAC will advise the CHMP and the Coordination Group for Mutual Recognition and Decentralised Procedures (CMDh) on safety issues associated with medicines authorised for the EU market (EUROPEAN MEDICINES AGENCY, 2013). The PhAC replaced the PhVWP.

Scientific societies dedicated to study the field of drug safety have been created. The International Society on Pharmacoepidemiology (ISPE) was officially launched in 1989 during the 5th International Conference on Pharmacoepidemiology and Risk Management (INTERNATIONAL SOCIETY FOR PHARMACOEPIDEMIOLOGY, 2014). The ISPE is a non-profit international professional membership organization provides a forum to the open exchange of scientific information for the field of pharmacoepidemiology, including pharmacovigilance, drug utilization research, outcomes research, comparative effectiveness research, and therapeutic risk management (INTERNATIONAL SOCIETY FOR PHARMACOEPIDEMIOLOGY, 2014). It counts with members of more than 53 countries. The International Society of Pharmacovigilance (ISOP) aims to foster Pharmacovigilance both scientifically and educationally, and enhance all aspects of the safe and proper use of medicines, in all countries (INTERNATIONAL SOCIETY OF PHARMACOVIGILANCE, 2014). It was created in 1992, initially under the name of European Society of Pharmacovigilance. The European Network of Centres for Pharmacoepidemiology and Pharmacovigilance (ENCePP) was created in 2006 by the EU as a project within the European Risk Management Strategy (ERMS) (EUROPEAN NETWORK OF CENTRES FOR PHARMACOEPIDEMIOLOGY AND PHARMACOVIGILANCE, 2014). Its goal is to further strengthen the postauthorisation monitoring of medicinal products in Europe by facilitating the conduct of post-authorisation studies focusing on safety and on benefit-risk (European Network Of Centres For Pharmacoepidemiology And PHARMACOVIGILANCE, 2014). This ENCePP comprises relevant research centres, healthcare databases, electronic registries and existing European networks covering certain rare diseases, therapeutic fields and adverse drug events of interest (EUROPEAN NETWORK OF CENTRES FOR PHARMACOEPIDEMIOLOGY AND PHARMACOVIGILANCE, 2014).

## I.3. PHARMACOVIGILANCE

During the clinical development, medicines are tested in a relatively short number of patients. Therefore, a randomized clinical trials (RCT) design are more likely to identify the most frequent and acutely ADRs (MADRE *et al*, 2006 LESKO and MITCHELL, 2012). Once a drug is marketed, more patients will receive treatment and their demographic characteristics are somehow more heterogeneous. Rare and long-latency AEs may arise and subsequently change the initial established benefit/risk profile. Data on drug safety from all available sources need to be collected and managed systematically in order to identify potential drug safety hazards as soon as possible (MADRE *et al*, 2006; STROM, 2012).

The identification of iatrogenic drug disease and the monitoring of its impact on a population perspective led to the development of a discipline of Pharmacoepidemiology - Pharmacovigilance (RAWLINS, 1995). The term "Pharmacovigilance" first appeared in medical literature in 1974 (MOORE, 2013).

Pharmacovigilance is defined as the science and activities relating to the detection, assessment, understanding and prevention of adverse effects or any other possible drug-related problems (WHO COLLABORATING CENTRE FOR INTERNATIONAL DRUG MONITORING, 2002). It is a multidisciplinary issue involving major disciplines as basic and clinical pharmacology, clinical medicine, toxicology, epidemiology and genetics (AKICI and OKTAY, 2007). The task of Pharmacovigilance is monitoring the safety of medicines and ensuring that the risks of a medicine do not outweigh the benefits, in the interests of public health (EUROPEAN MEDICINES AGENCY, 2013).

Pharmacovigilance has seen significantly developed over the past years (PAL et al., 2011). In developed countries, regulatory authorities have in force rigorous Pharmacovigilance legislations in order to seek greater transparency, accountability and access to information on safety (PAL et al., 2011). In Europe, a new Pharmacovigilance legislation is in force since July 2012 (COMMISSION DIRECTIVE 2010/84/EU, 2010). This new legislation allows EMA to maintain and further develop its tasks, in particular as regards the management of the Union pharmacovigilance database and data-processing network (the 'Eudravigilance database'), the coordination of safety announcements by the Member States and the introduction of the legal right for individual European citizens to report suspected adverse drug reactions.

## I.4. METHODS USED IN PHARMACOVIGILANCE

Spontaneously reported suspected ADRs by health care professionals, patients or market authorisation holders (MAHs) are the main source of information on drug safety issues to national pharmacovigilance systems. Since there is a need to quantify and characterize risks to individuals and communities from their medicines and, lately, to minimize their iatrogenic effects, other methodological designs are therefore needed (PAL et *al.*, 2013). The best method to address a specific safety issue depends on a number of variables that should be considered, such as the drug in cause and its therapeutic indication, the population being treated and the AE of interest (EUROPEAN MEDICINES AGENCY, 2005).

The nature of pharmacoepidemiologic study designs which support regulatory decisions on safety issues can be descriptive or analytical (MADRE *et al.*, 2006). Descriptive studies generate hypotheses and describe the occurrence of events related to drug toxicity and/or efficacy (HÄRMARK and VAN GROOTHEEST, 2008). These studies used to obtain the background rate of events and/or establish the prevalence of the use of drugs in specified populations (EUROPEAN MEDICINES AGENCY, 2005). Descriptive studies limit the inference made about causality and include spontaneous case reports, case series, uncontrolled cohorts and registries (MADRE *et al.*, 2006; STROM, 2012). Analytic studies are conducted to test research hypotheses aiming to evaluate the causal association between an observed event and a particular drug or drugs (HÄRMARK and VAN GROOTHEEST, 2008). Analytic studies include a comparator group and there are a variety of designs, such case-control studies, cohort studies and RCTs (MADRE *et al.*, 2006; STROM, 2012). Meta-analyses can be used to combine results from different studies (MADRE *et al.*, 2006; STROM, 2012).

This section aims to provide a summary of the most common pharmacovigilance methods used to study drug safety.

## I.4. I. DESCRIPTIVE STUDIES

### I.4.1.1. Spontaneous reports

According to the International Conference on Harmonisation of Technical Requirements for Registration of Pharmaceuticals for Human Use (ICH) definition, a spontaneous report is an unsolicited communication by a healthcare professional or

#### Chapter I

consumer to a company, regulatory authority or other organization (e.g. WHO, Regional Centre, Poison Control Centre) that describes one or more adverse drug reactions in a patient who was given one or more medicinal products and that does not derive from a study or any organized data collection scheme (EUROPEAN MEDICINES AGENCY, 2003). Pharmacovigilance centres collect reports of ADRs and evaluate the risk for new safety signals (HÄRMARK and VAN GROOTHEEST, 2008). Marketing authorisation holders also receive reports of their drugs (HÄRMARK and VAN GROOTHEEST, 2008).

Spontaneous reporting systems are the main source of post-marketing information on drug safety (HÄRMARK and VAN GROOTHEEST, 2008). A study conducted to evaluate FDA safety-related drug label changes in 2010 concluded that spontaneous reports contributed to safety-related label changes more than any other evidence source (LESTER *et al.*, 2013). Statistical methods can be applied to spontaneously reported data for signal detection, such as the Proportional Reporting Ratio (PRR), or the method used by the WHO, the Bayesian Confidence Propagation Neural Network (BCPNN). A safety signal can be defined as "information that arises from one or multiple sources (including observations and experiments), which suggests a new potentially causal association, or a new aspect of a known association, between an intervention and an event or set of related events, either adverse or beneficial, which would command regulatory, societal or clinical attention, and is judged to be of sufficient likelihood to justify verifiable and, when necessary, remedial actions" (HAUBEN and ARONSON, 2009). When spontaneously reported cases are the data source, a signal can be defined as a higher than expected relative frequency of a drug-event pair (MADRE *et al.*, DAL PAN, LINDQUIST and GELPERIN, 2012).

Spontaneous report of ADRs is a valuable method to identify rare a serious AEs with an acute onset and occurring with a close temporal relationship between the start of the treatment or following a dosage increment (MADRE *et al.*, 2006; DAL PAN, LINDQUIST and GELPERIN, 2012). Spontaneous reporting systems operate with a relatively low cost, allowing monitoring all drugs in market during their entire life cycles and covering the whole patient population (HÄRMARK and VAN GROOTHEEST, 2008). However, some limitations should be noted.

Adverse events with a long-latency period are less likely to be reported, since only unexpected and severe AEs are prone to be noticed by patients and healthcare professionals. The data accompanying spontaneous reports are frequently incomplete and the rate at which cases are reported is dependent on many factors including the length of time a drug has been on the market, media attention, and the indication for use of the drug

(EUROPEAN MEDICINES AGENCY, 2005). Other limitations of most importance are the underreporting and the selective reporting. A systematic review estimated the median underreporting rate across the included studies was 94% (HAZELL and SHAKIR, 2006). New drugs in market of drugs claiming to be safer are more likely to have their AEs reported (EDWARDS *et al.*, 2006).

Despite the irreplaceable value of spontaneous reporting systems, analytic studies should be conducted to follow-up safety signals generated by this method (EDWARDS *et al.,* 2006; STROM, 2012).

#### I.4.1.1.1. Targeted Spontaneous Reporting

The Targeted Spontaneous Reporting (TSR) is a variant method from the spontaneous reporting and was developed by the WHO (WORLD HEALTH ORGANIZATION, 2012). With TSR, healthcare professionals managing a group of patients are encouraged to report specific harmful events which are thought to be drug-related (PAL *et al.*, 2013). This method is sustainable and feasible and is being applied as a pharmacovigilance tool in countries with limited human and financial resources (PAL *et al.*, 2013). TSR was piloted for Human Immunodeficiency Virus (HIV) treatment programs in Kenya, Uganda and Vietnam and WHO is planning to use it to collect data on iatrogenic events from tuberculosis treatments (PAL *et al.*, 2013).

#### I.4.I.2. Case series

A case series are collections of cases, all of whom were subject to the same exposure, whose clinical outcomes are then exposed and evaluated (STROM, 2006; STROM, 2012). Alternatively, case series can be defined as collections of patients suffering the same outcome who will be evaluated in order to identify their previous exposure (STROM, 2006; STROM, 2012). No control group is included in case series. Cases occurring in the same hospital or medical practice constitute often a case series (STROM, 2006; STROM, 2012). This type of study can provide evidence of an association between a drug and an AE, but is more useful as a hypothesis generator methodology (EUROPEAN MEDICINES AGENCY, 2005).

# I.4.I.3. Intensive Monitoring

Commonly known as Prescription-Event Monitoring (PEM), an Intensive Monitoring programme is a method of active pharmacovigilance surveillance (EUROPEAN MEDICINES AGENCY, 2005). This methodology was developed in New Zealand (the Intensive Medicines Monitoring Programme) and in the UK (Prescription Event Monitoring) (HÄRMARK and VAN GROOTHEEST, 2008). The design of PEM consists in a non-interventional, observational prospective cohort with the aim of detecting any AE that may present during the treatment with a medicine (SHAKIR, 2007). This type of studies is frequently conducted for new drugs in the early postmarketing phase based on routine clinical practice (PAL *et al.*, 2013). In drug event monitoring, patients might be identified from electronic prescription data or automated health insurance claims (EUROPEAN MEDICINES AGENCY, 2005). Then, a questionnaire is sent to each prescribing physician or patient at specified intervals in order to obtain information on any AE (EUROPEAN MEDICINES AGENCY, 2005). Demographic characteristics of patients, indication for treatment, duration of therapy, dosage, clinical events, and reasons for discontinuation can be included in the questionnaire (EUROPEAN MEDICINES AGENCY, 2005). The physician or patients then return the questionnaire.

This method has a number of strengths (SHAKIR, 2007). It is a non-interventional study which does not interfere with the treatment chosen by the physician, diminishing the risk of selection bias. All the events occurring during the treatment should be reported which can lead to the detection of AEs which could be initially judge as non-related to the drug. Long-term latency ADRs can be explored and the patients' cohort can be followed after the end of the study (SHAKIR, 2007). However, as any other pharmacoepidemiologic study, some limitations should be considered. Not all the questionnaire forms are returned to the sponsor of the study. A PEM depends on physicians reporting, so the underreporting is possible to exist (LAYTON and SHAKIR, 2012). The PEM process developed in the UK by the Drug Safety Research Unit is described in Figure I.1.

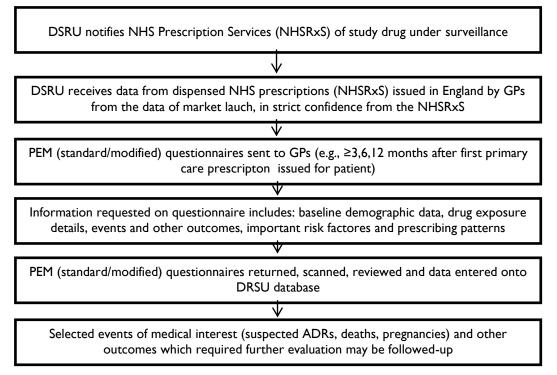

Figure I.I - The Prescription-Event Monitoring process (LAYTON and SHAKIR, 2012).

# I.4.2. ANALYTIC STUDIES

# I.4.2.1. Randomized controlled clinical trials

Randomized clinical trials are classified in four phases: phase I, phase II, phase III and phase IV (STANLEY, 2007). RCTs where the pharmacokinetics and pharmacodynamics are initially study are known as phase I RCTs. Phase I RCTs include healthy volunteers. Phase I and phase II RCTs are conducted to establish the initial safety profile, to set the dose range and to collect the first data on the efficacy of the drug (STANLEY, 2007). The initial clinical development of a drug usually includes few hundreds of individuals (ROSENSTOCK *et al.*, 2012). The best evidence on the efficacy and safety of a drug seeking market authorisation or extension of its therapeutic indication is retrieved from RCTs, in particular from Phase III RCTs which include hundreds to thousands of patients (MADRE *et al.*, 2006; LESKO and MITCHELL, 2012). The time length depends on the relative incidence of the chosen endpoint and the simple size is estimated based on the power required to demonstrate a statistical

Chapter I

different between groups on a clinical effect (MADRE *et al.*, 2006; LESKO and MITCHELL, 2012). The phase IV RCTs, conducted after a medicine is marketed, aim to provide additional details about the medicine's efficacy or safety profile (AMGEN, 2012). The detection and more rigorous assessment of previously unknown or inadequately quantified AEs are an important role of phase IV RCTs (STROM *et al.*, 2008). A particular type of clinical trial useful to conduct postmarketing safety profile assessments is the Large Simple Trial (LST). Large Simple Trials are considered the best solution when it is not possible to completely contro confounding by means other than randomization (LESKO and MITCHELL, 2012). This type of RCT has been used to study the risk of adverse drug effects when observational designs may be judged inadequate (LESKO and MITCHELL, 2012; LESKO and MITCHELL, 1995).

The most frequent and acute drug-related AEs can be detected during the premarket clinical development (MADRE et al., 2006; LESKO and MITCHELL, 2012). Most of what is known about the safety profile of a drug comes from harmful effects reported during RCTs. Nonetheless, it is highly probable that serious unexpected suspected ADRs may occur after a drug being introduced in market. The total patient size of Phase III RCTs commonly rounds the few thousands (MADRE et al., 2006; LESKO and MITCHELL, 2012). Clinical trials are not designed to evaluate the risk for rare and/or long-term latency AEs. Other limitation of RCTs is the inclusion/exclusion criteria for patients (MADRE et al., 2006; LESKO and MITCHELL, 2012). Patients included in RCTs are treated in well-defined indication and may receive a limited number of concomitant drugs (MADRE et al., 2006; LESKO and MITCHELL, 2012). Additionally, individuals of particular groups such as elderly, children or pregnant women are usually underrepresented or excluded (HÄRMARK and VAN GROOTHEEST, 2008). When safety issues arise from RCTs they usually occur unexpectedly and most of the times they are not prespecified outcomes (BOMBARDIER et al., 2000).

Since RTCs are mainly conducted to demonstrate clinical efficacy during clinical development they tend to be unnecessary after a market authorization to be granted (STROM, 2006; STROM, 2012). The exception is when therapeutic indication extensions are required. Ethical issues restrain RCTs to be conducted in order to evaluate safety issues. However, in some situations such studies can be conducted in order to analyze the serious risks arising from medicines, in particular if such safety concerns could be adequately expressed as safety endpoints (US FOOD AND DRUG ADMINISTRATION, 2011). According to FDA guidance, examples include RCTs designed to (US FOOD AND DRUG ADMINISTRATION, 2011):

- Evaluate the occurrence of asthma exacerbations associated with an irritative component of inhalation treatments for asthma in a RCT, where the increased risk of drug-related exacerbation has the potential to offset the effectiveness of the inhaled drug;
- Determine the incidence of myocardial infarction in patients treated with the approved drug in a follow-on trial after approval, using the original randomized population;
- Evaluate differences in safety outcomes between patients withdrawn from treatment after some period of treatment and patients who remain on the treatment (randomized withdrawal trial);
- Evaluate the potential for QT interval prolongation in a thorough QT interval RCT;
- Measure growth and neurocognitive function in pediatric patients treated chronically with the drug\*;
- Evaluate safety in a particular racial or ethnic group or vulnerable population such as the immunocompromised\*;
- Evaluate the safety of the drug in pregnant women\*;
- Evaluate drug toxicity in patients with hepatic or renal impairment\*;
- Evaluate long-term safety of cell and gene therapy products depending on the type of vector used and the inherent risk of integration;
- Evaluate the safety of a drug in patients with HIV-1 co-infected with hepatitis C or B\*

\* - Patients are treated with the drug at a dose and schedule specified in the RCT protocol.

Due to ethical and design limitations of RCTs, observational study designs are main data sources supporting pharmacovigilance activities.

# I.4.2.2. Observational studies

# I.4.2.2.1. Case-control studies

A study authored by Janet Lane-Claypon in 1926 and published by the British Ministry of Health entitled "A further report on cancer of the breast: reports on public health and medical subjects." is considered the first case-control study (PANETH, SUSSER and SUSSER, 2002). In case-control studies, cases with a disease (or event) are compared with controls without the disease looking for differences in previous exposures (Figure I.2) (STROM, 2006; ROSENBERG, COOGAN and PALMER, 2012). The prevalence of exposure among the controls should represent the prevalence of the exposure in the source population (EUROPEAN MEDICINES AGENCY, 2005).

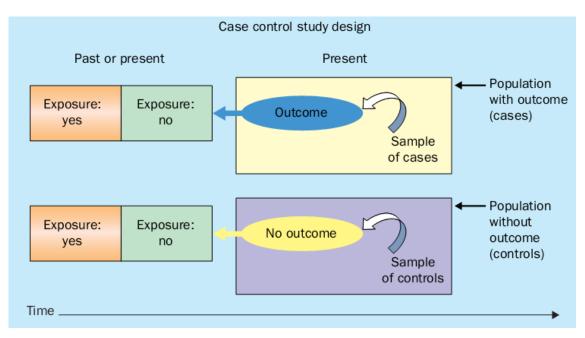

Figure 1.2 - Schematic diagram of a case-control study design (SCHULZ and GRIMES, 2002).

Case-control studies are useful when it is aimed to study multiple causes of a disease since the same cases and controls can be used to examine any number of exposures as potential risk factors (STROM, 2006; ROSENBERG, COOGAN and PALMER, 2012). This design is often used to investigate the risk for developing rare AEs or the cause of a disease with a long latency period, since conducting a cohort study with the same objective would be less efficient in terms of time, money and efforts (SCHULZ and GRIMES, 2002). Information on individuals' exposures is generally obtained in a retrospective fashion. Patients are commonly recruited from databases containing their medical records, but data can be collected specifically for the study, by administering questionnaires or conducting interviews (EUROPEAN MEDICINES AGENCY, 2005). This retrospective data collection procedure on the exposure has the risk of a poor validation (STROM, 2006; ROSENBERG, COOGAN and PALMER, 2012). Moreover, controls selection is difficult and its inappropriate sampling can introduce bias in the study (STROM, 2006; ROSENBERG, COOGAN and PALMER, 2012).

Incidence rates cannot be estimated from case-control studies (SCHULZ and GRIMES, 2002). Instead, the odds ratio (OR) should be used to compare the different proportion of

exposed individuals among cases and controls groups (SCHULZ and GRIMES, 2002; EUROPEAN MEDICINES AGENCY, 2005). The OR is a good estimate of the relative risk (RR) when rare events are being studied (SCHULZ and GRIMES, 2002).

## I.4.2.2.2. Cohort studies

Wade Hampton Frost, an epidemiologist, was the first to use the word "cohort" in his publication assessing the age-specified mortality rates and tuberculosis, in 1935 (FROST, 1935; SONG and CHUNG, 2010). In cohort studies, a population-at-risk for a disease or an event is followed over time for the occurrence of such disease or event (EUROPEAN MEDICINES AGENCY, 2005). Cohort studies can be prospective or retrospective, since investigators can go forward in time or go back in time to select the cohort (Figure I.3) (GRIMES and SCHULZ, 2002).

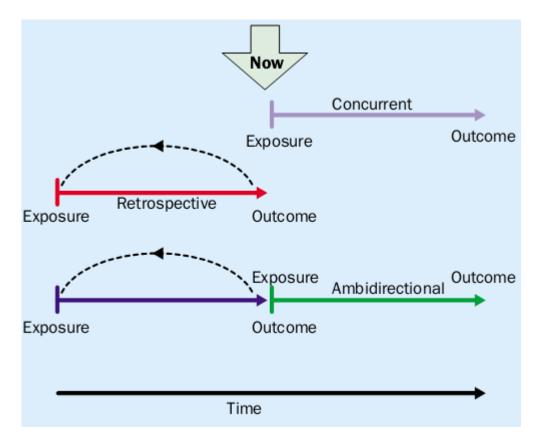

Figure 1.3 - Schematic diagram of cohort study design possibilities: concurrent (prospective), retrospective and ambidirectional (GRIMES and SCHULZ, 2002).

A bidirectional design can also exist when data is collected in both directions (GRIMES and SCHULZ, 2002). Typically, two or more groups of patients are followed from exposure to outcome (GRIMES and SCHULZ, 2002). Usually, cohort studies are used to compare a group of exposed patients to a group of unexposed or to compare groups under different exposures (STROM, 2006; STROM, 2012). If the groups have different frequencies in outcomes, then an association can be suggested (GRIMES and SCHULZ, 2002).

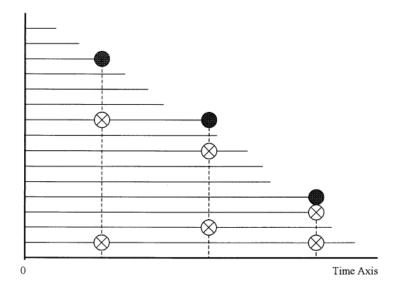

The basic difference between cohort and case-control studies is the way that the patients are recruited into the study (GRIMES and SCHULZ, 2002). Into a cohort study, patients are recruited based on presence of absence of an exposure and are then followed over time to study their disease course (GRIMES and SCHULZ, 2002). Patients are recruited into a case-control study based on presence of absence of an outcome (e.g: AE or disease), and their previous exposures are then evaluated (GRIMES and SCHULZ, 2002).

Cohort studies offer several advantages. They are the best design to document the natural history of a disease or the incidence of an AE (GRIMES and SCHULZ, 2002). Multiple outcomes can be investigated using the same data source (EUROPEAN MEDICINES AGENCY, 2005). However, this can arise methodological issues since the sample size may not be large enough to study rare events. Cohort studies are useful to estimate incidence rates and relative risks (RRs) and they can reduce the risk of survival bias when compared with case-control studies (GRIMES and SCHULZ, 2002). As examples of limitations of cohort studies, one can be pointed out are the risk for selection bias, the difficult of studying the risk for rare and long latency events and the lost for follow-up of patients (STROM, 2006; STROM, 2012; GRIMES and SCHULZ, 2002).

### I.4.2.2.3. Nested case-control studies

The nested case-control design differs from the traditional case-control design in that it is "nested" in a well-defined cohort, for which information on all members can be obtained (ESSEBAG *et al.*, 2003). The nested case-control design was introduced by Mantel in 1973. There are four crucial steps in the design of nested case-control studies: define the cohort's time axis; select all the cases (all subjects with the outcome of interest); form all risk sets corresponding to the cases, and; randomly select one or more controls from each risk set (SUISSA, 2006; SCHNEEWEISS and SUISSA, 2012). The risk set consist in all noncases (considered to be at risk of becoming cases) present in the cohort at the time the case becomes a case

(ESSEBAG et al., 2003). The most appropriate method to select controls is random selection, without replacement, of noncases presented at the risk set of each case (ESSEBAG et al., 2003). Selection of controls only from noncases or not use subjects more than once as controls can introduce bias in the risk estimation (SUISSA, 2006; SCHNEEWEISS and SUISSA, 2012). A case-control study design is illustrated in Figure I.4 (ESSEBAG et al., 2003).

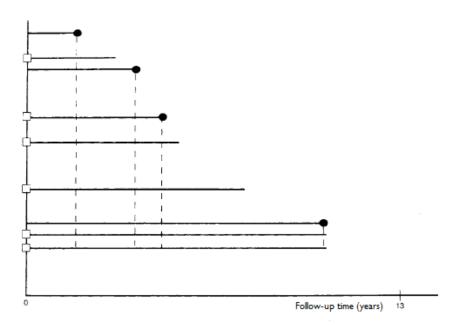

**Figure 1.4** - The design of a nested case-control study (ESSEBAG et al., 2003). In this example, there are 2 controls (white circles with a X) for every case (black circles). Follow-up is represented by horizontal black lines, beginning at the zero-time. One should be notice that a future case may be selected as a control for a prior case, and that a given subject may be selected as a control for 2 different cases.

Nested case-control studies are used to conduct internal comparisons (within the cohort) between exposures to different drugs (SUISSA, 2006; SCHNEEWEISS and SUISSA, 2012). This design can also be used to compare the rates of AEs within a cohort with those occurring in the general population, with proper adjust for variables such sex or age (SUISSA, 2006; SCHNEEWEISS and SUISSA, 2012).

#### I.4.2.2.4. Case-cohort studies

The design of a case-cohort study was proposed by Prentice in 1986 (PRENTICE, 1986; ESSEBAG *et al.*, 2003). A case-cohort study begins with the definition of a cohort time axis, followed by the selection of all cases, like a nested case-control design (Figure I.5) (SUISSA, 2006; SCHNEEWEISS and SUISSA, 2012). The difference is the controls' selection process. In a case-cohort study, a random sample of a predetermined size, usually called subcohort, is

selected from the cohort (SUISSA, 2006; SCHNEEWEISS and SUISSA, 2012). For every case, a risk set is established (as in the nested case-control study) of all noncases at risk at the time the case becomes a case (ESSEBAG et al., 2003). All members of the predefined subcohort present in a case's risk set are used as controls for the case (as opposed to the random selection of X controls from each case's risk set in the nested case-control study) (ESSEBAG et al., 2003). It is possible that a future case included in the subcohort serves as a control for all cases occurring before the future case becomes a case (ESSEBAG et al., 2003).

**Figure 1.5** - The design of a case-cohort study (SUISSA, 2006). In this example, there are 4 cases (black circles). Follow-up is represented by horizontal black lines, beginning at the zero-time.

### I.4.2.2.5. Cross-sectional studies

A cross-sectional study examines exposure(s) and outcome(s) in a population at one point in time; they have no time sense. These studies are conducted to gather data for surveys or for ecological analyses (EUROPEAN MEDICINES AGENCY, 2005). No temporal relationship between an exposure and an outcome can be directly addressed (EUROPEAN MEDICINES AGENCY, 2005). These studies can estimate the prevalence of an event at a time in a population.

# I.4.2.3. Registry studies

According to the Agency for Healthcare Research and Quality (AHRQ) definition "a patient registry is an organized system that uses observational study methods to collect uniform data (clinical and other) to evaluate specified outcomes for a population defined by a particular disease, condition, or exposure, and that serves one or more predetermined scientific, clinical, or policy purposes." (GLIKLICH and DREYER, 2010). Registries conducted to collect data on diseases, such blood dyscrasias, severe cutaneous reactions, or congenital malformations can be used to investigate previous drug exposures or other factors associated with the clinical condition (EUROPEAN MEDICINES AGENCY, 2005). This method can be used to perform case-control studies since drug exposure from cases identified in the registry can be compared with drug exposure from controls which can be selected from either patients with other condition from the registry or patients outside the registry (EUROPEAN MEDICINES AGENCY, 2005). Registries can also be conducted to collect data exposure to drugs of interest, called exposure registries (EUROPEAN MEDICINES AGENCY, 2005). Exposure registries focus on patients treated with a particular drug, studying the effects of the selected therapeutic in a population of interest, such pregnant women (GLIKLICH and DREYER, 2010). In both types of registries, forms such as a questionnaire or an AEs' case report form can be used to collect the information from providers or patients in a prospective way (GLIKLICH and DREYER, 2010). Cohort studies can be conducted since registries allow patients to be followed over time (EUROPEAN MEDICINES AGENCY, 2005). Despite no control group is included in this methodology, registries allow studying the incidence of AEs and, in the presence of new evidence, they can be used for signal generation (EUROPEAN MEDICINES AGENCY, 2005).

### I.4.2.4. Studies conducted based on automated databases

Once a hypothesis for a safety signal is generated it is necessary to test the hypothesis, most of times by conducting longitudinal studies, such cohorts or case-controls. Since rare and/or long-term latency serious suspected adverse drug reactions are those of most concern, postmarketing studies usually included 10000 exposed persons in a cohort study or enrol diseased patients from a population of equivalent size for a case-control study (STROM, 2006b; STROM, 2012a). It may not be feasible and cost-effective to conduct studies requiring such sample sizes and time length by collecting original primary data. For all these

reasons, the use of computerised automated databases as data sources for pharmacoepidemiology studies has grown in the past decades (STROM, 2006b; STROM, 2012a). Automated databases have been used for pharmacoepidemiology research in North America since 1980s and they were initially created for administrative purposes (STROM, 2006b; STROM, 2012a).

There are two main types of automated databases (EUROPEAN MEDICINES AGENCY, 2013). Those that contain comprehensive medical information, which include prescriptions, diagnosis, referrals and discharge reports, such the Clinical Practice Research Datalink (CPRD). The other type of databases are those mainly created for administrative purposes, which require a record-linkage between pharmacy claims and medical claims databases, such the PHARMO system in The Netherlands or the Medicaid in the USA (EUROPEAN MEDICINES AGENCY, 2013). These databases may include data on millions of patients. However, they may not have the detailed information on some variables that are valuable more accurate research, such as validated diagnostic information or laboratory data (EUROPEAN MEDICINES AGENCY, 2013). Guidelines were created to assist investigators in the selection and use of data resources for an observational study in pharmacoepidemiology by highlighting potential limitations and recommending tested procedures (HALL *et al.*, 2012).

## I.4.3. STUDIES' METHODOLOGICAL QUALITY ASSESSMENT

The critical appraisal of the methodological quality of studies included in systematic reviews or meta-analysis is an essential feature (MOJA et al., 2005). The methodological quality can be considered a multidimensional concept, which could relate to the design, conduct, and analysis of a study, its clinical relevance, or quality of reporting (JÜNI, ALTMAN and EGGER, 2001). Defects in the methodological quality of studies may bias their results, and hence the results of meta-analyses where they were included (WOOD et al., 2008). Kjaergard and colleagues (2001) conducted a study to explore whether reported methodologic quality affects estimated intervention effects in RCTs and contributes to discrepancies between the results of large sized RCTs and small sized RCTs in metaanalyses. The authors found that, compared with large RCTs, estimates of intervention benefits were exaggerated in small RCTs with inadequate allocation sequence generation, inadequate allocation concealment, and no double blinding (KJAERGARD, VILLUMSEN and GLUUD, 2001). Effect size estimates from large RCTs did not differ significantly from small RCTs with adequate generation of the allocation sequence, adequate allocation concealment, or adequate double blinding (KJAERGARD, VILLUMSEN and GLUUD, 2001). Moher and colleagues (1998) replicated 11 meta-analyses in order to explore the effects of quality on the quantitative results. The authors concluded that the interpretation of the benefit of an intervention from the results of a meta-analysis including low methodological quality studies can be altered (MOHER et al., 1998). However, other studies did not find a correlation between studies' methodological quality and differences in estimated effect sizes (WOOD et al., 2008).

There are several instruments and checklists to assess the methodological quality of RCTs and non-randomized studies. The assessment of randomization process, concealment of allocation process, blinding of participants and outcomes assessment, patients' withdrawal or selective outcome reporting are some of domains assessed by investigators regarding RCTs quality (JÜNI *et al.*, 1999). Nevertheless, the number of items considered for evaluation from one instrument to another can vary significantly (JÜNI *et al.*, 1999). The recommendations from the Cochrane Collaboration, or the scales of Jadad and colleagues (1996), Destky and colleagues (1992) or Chalmers and colleagues (1981) are examples of instruments frequently used to critically appraisal RCTs methodological quality. Deeks and colleagues (2003) conducted a review of methods and related evidence for evaluating bias in non-randomized studies. They identified 194 different instruments and scales used to assess

Chapter I

the methodological quality of non-randomized studies (DEEKS *et al.*, 2003). The allocation process, the comparability of groups, and the adjustment of data for sociodemographic characteristics of patients, also called case-mix adjustment, are domains taken into consideration when assessing the methodological quality of non-randomized studies (DEEKS *et al.*, 2003). The Downs and Black instrument (1998) and the Newcastle-Ottawa Scale (WELLS *et al.*, 2014) are examples of instruments frequently used to assess the methodological quality of non-randomized studies.

# I.5. META-ANALYSIS

Meta-analysis is defined as "the statistical analysis of a collection of analytic results for the purpose of integrating the finding" (BERLIN, CEPEDA and KIM, 2012). This involves the statistical combination of summary statistics from various studies but this technique can also combine raw data (EUROPEAN MEDICINES AGENCY, 2001). One should make a distinction between meta-analysis and systematic review. The term 'meta-analysis' should be restricted to the process of statistical synthesis. A systematic review comprises "the application of strategies that limit bias in the assembly and critical appraisal of all relevant studies on a specific topic" (CHALMERS and ALTMAN, 1995). A meta-analysis may be, but not necessarily, part of systematic review process.

There are a number of reasons to conduct a meta-analysis (EUROPEAN MEDICINES AGENCY, 2001):

- I) To provide a more precise estimate of the overall treatment effects;
- To evaluate whether overall positive results are also seen in pre-specified subgroups of patients;
- To evaluate an additional efficacy outcome that requires more power than the individual trials can provide;
- 4) To evaluate safety in a subgroup of patients, or a rare AE in all patients;
- 5) To improve the estimation of the dose-response relationship;
- 6) To evaluate apparently conflicting study results.

#### I.5.1. THE EVOLUTION OF RESEARCH SYNTHESIS AND META-ANALYSIS

An historical perspective on the evolution of research synthesis has been presented by Keith O'Rourke (2007) in a paper published in 2007. The study of Karl Pearson was one of the firsts to combine observations from different clinical studies (PEARSON, 1904). Published in 1904, this study was conducted to evaluate the effectiveness of typhoid vaccine, by comparing the infection and mortality rates among soldiers who have been inoculated with those who have not. Besides medical sciences, research synthesis was conducted addressing issues in other scientific fields, like astronomy and zoology (SUTTON, and HIGGINS, 2008).

Despite initial research synthesis has been developed more than one century ago, their acceptance and frequent application took a while. Combine data from different studies and take conclusion on an investigational issue was frequently done throw narrative reviews (BORENSTEIN *et al.*, 2009). Studies addressing a research question were reviewed by an expert in the field, who summarized the findings and discussed the results, and then reached a conclusion. However, since a narrative review is a subjective procedure by nature, this technique has been abandoned by researches. Systematic reviews and meta-analyses started to gain relevance due to the need for medical research and clinical practice to be based on the most robust scientific evidence (SUTTON, and HIGGINS, 2008). These techniques use a set of rules to search for studies, and then to determine which studies will be included or excluded from the analysis (BORENSTEIN *et al.*, 2009).

The increasing number of research reports led investigators to develop methods to synthesize results from different studies (O'ROURKE, 2007). One of the first quantitative syntheses of identical studies concerning a common research issue was published in 1940 by JG Pratt and colleagues, which evaluated the more than 100 reports on extrasensory experiments (O'ROURKE, 2007). The term "meta-analysis" was coined by Gene V. Glass in 1976 (1976), which he referred to "the statistical analysis of a large collection of analysis results from individual studies for the purpose of integrating the findings". An editorial was anonymously published in *The Lancet* journal in 1980 reported a meta-analysis assessing whether aspirin could reduce the risk for myocardial infarction (ANONYMOUS, 1980; O'ROURKE, 2007). This meta-analysis was conducted by Archibald Cochrane and Peter Elwood due to doubts surrounding the beneficial effect of aspirin in cardioprotection (ELWOOD *et al.*, 1974; O'ROURKE, 2007). Many meta-analyses have been published ever since, as well as books and papers on meta-analysis' methodology (O'ROURKE, 2007).

Archibald Cochrane drew attention to the lack of organized critical summary of clinical evidence, by specialty, which could be updated periodically in order to support physicians to perform clinical judgments (VOLMINK *et al.*, 2004). The UK's National Perinatal Epidemiology Unit is a multidisciplinary research unit which was established at the University of Oxford in 1978. This working group conducted "methodologically rigorous research to provide evidence to improve the care provided to women and their families during pregnancy, childbirth, the newborn period and early childhood as well as promoting the effective use of resources by perinatal health services." The investigators systematically reviewed RCTs in perinatal medicine, using meta-analysis when appropriate and possible, which resulted on a two-volume book "Effective Care in Pregnancy and Childbirth" and in a companion volume "Effective Care of the Newborn Infant" (STARR *et al.*, 2009). The knowledge produced by this international collaboration led Michael Peckham, first Director

General Introduction

of Research & Development in the British National Health Service, to approve funding for 'a Cochrane Centre' "to facilitate the preparation of systematic reviews of RCTs of healthcare" (THE COCHRANE COLLABORATION, 2013a). In the following year, the Cochrane Collaboration was inaugurated in Oxford, England, as well as the firsts Cochrane Review Groups, aiming to collate and synthesize high-quality evidence on the effects of healthcare interventions which results could be consulted by a worldwide multi-disciplinary audience (SUTTON, and HIGGINS, 2008). The contribution of the Cochrane Collaboration was recognized as leading to important methodological advances in the systematic reviews and meta-analyses field (GRIMSHAW, 2004). Additionally, the Cochrane Reviews were considered being of great quality (GRIMSHAW, 2004). In 2013, more than 31,000 dedicated people from over 120 countries integrated the Cochrane Collaboration international network, with more than 5000 Cochrane Reviews published online in the Cochrane Database of Systematic Reviews (THE COCHRANE COLLABORATION, 2013B).

## **I.5.2. CLINICAL RELEVANCE OF CONDUCTING A META-ANALYSIS**

Meta-analysis has been widely explored by investigators as a methodology to conduct clinical research (PATSOPOULOS, ANALATOS and IOANNIDIS, 2005). Investigators may have several interests to conduct a meta-analysis aiming to clarify a research question which may not be properly addressed with other study designs (BERLIN, CEPEDA and KIM, 2012). In several occasions, the study of rare AEs relies on pooled analysis. Meta-analysis may be a valuable tool when there is the need to explore inconsistencies across studies previously conducted, to evaluate subgroups of patients in whom an intervention may be more or less effective or to compare the efficacy and/or safety of several interventions.

By applying statistical methods and pooling an estimate of the effect size, metaanalysis allows discussing the magnitude of the effect between the intervention being evaluated and the selected comparator (BORENSTEIN *et al.*, 2009). Narrative reviews do not provide mechanisms to synthesise data and present a subjective evaluation of the selected studies (BORENSTEIN *et al.*, 2009).

#### **I.5.3. A PROTOCOL TO CONDUCT A META-ANALYSIS**

A meta-analysis should be conducted according to a prespecified protocol and the steps involved in the process should be clarified before starting the work (MOHER *et al.*,

1999; MOHER et al., 2009; STROUP et al., 2000; EUROPEAN MEDICINES AGENCY, 2001). Guidelines have been developed to improve the quality of the reporting of meta-analyses. Investigators can find recommendations to report meta-analysis of randomised trials, like The Quality of Reporting of Meta-analyses (QUOROM) statement, lately updated by the Preferred Reporting Items for Systematic reviews and Meta-Analyses (PRISMA) recommendations (MOHER et al., 1999; MOHER et al., 2009). The Meta-analysis Of Observational Studies in Epidemiology (MOOSE) guidelines have been developed to help reporting meta-analysis of observational studies (STROUP et al., 2000). These guidelines were also developed to help reviewers, editors, and readers to interpret meta-analyses. Defining a protocol based on such recommendations allows the replication of the meta-analysis. Generally, several points should be considered:

- Define precisely the objective of the meta-analysis and state the investigational hypothesis.
- 2) Perform a literature search:

The authors should report the search strategy with the keywords and the index terms, specify which databases were searched, report if hand searching or contact with authors were employed or not, if literature other than English was consulted, or if unpublished material was used.

3) Establish the inclusion/exclusion criteria:

Based on the initially established objective, the author should set of rules for including and excluding studies from the meta-analysis. These criteria are usually based on study design (e.g.: only RCTs, only observational studies or include both type), study populations (e.g.: elderly, pregnant, young patients, or establish age groups), different treatment dosages, or different studies' duration.

4) Describe the data collection process:

Describe the methodology used to extract data from studies' reports (e.g.: extraction by investigators in an independently fashion, extraction in duplicate) and the process used to confirm the data extracted.

5) Statistical methods employed:

The authors should describe the statistical methodology employed to conduct the meta-analysis. Which effect size was used (e.g.: OR, RR, Risk difference [RD]); which meta-analytic model was used (e.g.: fixed or random effects models) and the justification of whether the chosen models account for predictors of study results; describe if the association between two variables was evaluated by means of a meta-regression (e.g. dose-response effect, age-severity of event); describe if cumulative meta-analysis was used to evaluate who results perform over time. The authors should also state which methods were used to evaluate between-study heterogeneity and the publication bias.

6) Evaluate the consistency of the results:

It is usual to describe a sensitivity analysis which allows evaluating the consistency of the results. For example, integrate data according different study designs, study durations, according different treatment doses or subpopulations.

7) Formulate conclusions and recommendations according the results.

#### **I.5.4. EFFECT SIZE MEASURES**

The effect size is the term used to refer to OR, RR or RD, which are common in meta-analyses that deal with medical interventions (BORENSTEIN *et al.*, 2009). Different effect size measures are used depending on when there is a need to quantify a relationship between two variables or a difference between two groups must be calculated (BORENSTEIN *et al.*, 2009).

According to Borenstein and colleagues (2009), there are some considerations that should drive the choice of an effect size. First, the effect size from different studies should be comparable to one another since they measure the same thing. Secondly, the estimate of the effect size should be computable from the information that is reported in the publish literature, as an article, and should not require the re-analysis of the raw data. Third, an effect size should have good technical properties, like knowing its sampling distribution in order to allow the estimation of its variance and confidence intervals.

Borenstein and colleagues (2009) also refer that most of the times the selected effect size is based on the kind of data that was reported in the primary studies. Table I.I describes the more common effect sizes and the correspondent study designs. If the summary data reported in the primary studies are based on a binary outcome, such events and non-events in two groups, then the appropriate effect size to select it will be the relative risk (RR), the OR or the RD. These effect size measures can be calculated from 2 x 2 tables. If, instead, the summary data reported in the primary studies are based on means and standard deviations in two groups, it will be more appropriate to select the raw difference in means or the standardized mean difference. A correlation coefficient should be selected when a correlation between two variables is reported in primary data. There is also the option of

compute time-to-event outcomes, also called survival analysis (HIGGINS and GREEN, 2011). Time-to-event data arise when the interest is focused on the time elapsing before an event is experienced. The most appropriate way of summarizing time-to-event data is to use methods of survival analysis and express the intervention effect as a hazard ratio (HR) (HIGGINS and GREEN, 2011). The notion of risk and hazard is similar, but is subtly different in that it measures instantaneous risk and may change continuously (e.g.: the hazard of death changes as someone crosses a busy road) (HIGGINS and GREEN, 2011). Hazard ratio is interpreted similarly to RR, as it describes how many times more (or less) likely a participant is to suffer the event at a particular point in time if they receive the experimental rather than the control intervention. Hazard ratios are computed for each study and meta-analysis is used to integrate data from all studies (BORENSTEIN *et al.*, 2009).

**Table I.I** - Most common effect size measures used in meta-analysis and their correspondent study designs (adapted from BORENSTEIN *et al.*, 2009).

| Effect sizes based on means (continuous data)            |
|----------------------------------------------------------|
| Raw (unstandardized) mean difference (D)                 |
| Based on studies with independent groups                 |
| Based on studies with matched groups or pre-post designs |
| Standardized mean difference (d or g)                    |
| Based on studies with independent groups                 |
| Based on studies with matched groups or pre-post designs |
| Effect sizes based on binary data                        |
| Relative risk (RR)                                       |
| Based on studies with independent groups                 |
| Odds ratio (OR)                                          |
| Based on studies with independent groups                 |
| Risk difference (RD)                                     |
| Based on studies with independent groups                 |
| Effect size based on correlational data                  |
| Correlation (r)                                          |
| Based on studies with one group                          |

#### **I.5.5. STATISTICAL ANALYSES**

## I.5.5.1. Statistical models

Two models can be used to assess the way in which the variability of the results between the studies included in the meta-analysis is treated: the fixed effects model and the random effects model (PANESAR, SIOW and ATHANASIOU, 2010).

#### I.5.5.1.1. Fixed effects meta-analysis

Under the fixed effects model it is assumed that all studies in the meta-analysis share a common (true) effect size and that all differences in observed effects are due to sampling error (BORENSTEIN *et al.*, 2009). In other words, if a meta-analysis of ORs is being conducted, it is assumed that all studies estimate the same OR (PANESAR, SIOW and ATHANASIOU, 2010). If each study had an infinite sample size the sampling error would be zero and the observed effect for each study would be the same as the true effect (BORENSTEIN *et al.*, 2009). However, since the simple size of each study is not infinite, there is sampling error and the observed effect in the study is not the same as the true effect.

In the context of a fixed effects meta-analysis, each is assumed to be a random representative conducted on a homogeneous population of patients, assuming that each study is identical to one another (PANESAR, SIOW and ATHANASIOU, 2010). Thus, this model assumes that there is no statistical heterogeneity among the studies and the summary measure is a simple weighted average and can be interpreted as an estimate of a single population outcome measure (PANESAR, SIOW and ATHANASIOU, 2010).

In a fixed effects meta-analysis, the methods used to analyse binary outcome data are: the inverse variance-based method, the Mantel-Haenszel method, and the Peto's method. The inverse variance-based method is so called because the weight attributed to each study is calculated as the inverse of the variance of the effect estimated, or the inverse of the square of its standard error (BORENSTEIN *et al.*, 2009). Larger studies with smaller standard errors are given more weight than small sized studies with larger standard errors (PANESAR, SIOW and ATHANASIOU, 2010). The weighted average (estimated effect size) calculation based on the fixed effects model is given by:

$$M = \frac{\sum_{i=1}^{k} WiYi}{\sum_{i=1}^{k} Wi}$$

where W<sub>i</sub> is

$$Wi = \frac{1}{V_{Yi}}$$

 $V_{Yi}$  is the within-study variance for study *i*.

For most purposes the inverse variance-based method is appropriate, but when studies have small sample sizes, or when events are rare, other methods can have better statistical properties (BORENSTEIN *et al.*, 2009). When studies have large sample sizes, the variance estimation is close to the true variance of that study, as assumed by the inverse variance-based method. However, the variance may not be well estimated when studies are small or the events are rare (BORENSTEIN *et al.*, 2009). The Mantel-Haenszel method uses a different weighting scheme based on which effect size measure is being used (e.g. RR, OR or RD) and not requiring variance to be estimated (BORENSTEIN *et al.*, 2009). The Mantel-Haenszel method has better statistical properties when there are few events and has become the default method for the fixed effects analysis (PANESAR, SIOW and ATHANASIOU, 2010). The Mantel-Haenszel method was developed to combine OR across 2 x 2 tables and it has since been extended to combine RR or RD across 2 x 2 tables (BORENSTEIN *et al.*, 2009).

The Peto's method, also called the one-step method, can only be used to pool ORs and is a variant of the inverse variance-based method (BORENSTEIN *et al.*, 2009). This method uses an approximate method to estimate the log OR and uses different weights (PANESAR, SIOW and ATHANASIOU, 2010).

The inverse variance-based formula does not work well when one or more cells in the 2 x 2 table have a value of zero (BORENSTEIN *et al.*, 2009). The approach is to add the value of 0.5 to all four cells. Both the Mantel-Haenszel and Peto's methods are able to work with zero values and no adjustments are needed (BORENSTEIN *et al.*, 2009). However, in the Peto's method work better when one is aiming to pull data from studies with small treatment effects (OR close to I), events are rare and the experimental and control groups have a similar number of participants (PANESAR, SIOW and ATHANASIOU, 2010). In other scenarios different than this, it has shown to give biased results.

The advantages and disadvantages of those methods have been pointed out (PANESAR, SIOW and ATHANASIOU, 2010). Peto's method can produce biased results when there is a mismatch in the number of participants between the experimental and control groups. If the number of studies to be included is small but their simple sizes are large, then the inverse variance-based method is the most appropriate to be employed. If an opposite situation occurs, then the Mantel-Haenszel method should be chosen. It is recommended that a continuity correction should be used (add 0.5 to each cell of a 2 x 2 table) for sparse data, except when very little heterogeneity exists among studies.

### I.5.5.1.2. Random effects meta-analysis

The previous described model of the fixed effects assumes that the true effect size is the same in all studies (BORENSTEIN *et al.*, 2009). However, this assumption is not plausible for most of the systematic reviews and meta-analysis. One may assume that a group of studies have enough in common to be included in a meta-analysis, but there is generally no reason to assume that the true effect size is the same in all the studies (BORENSTEIN *et al.*, 2009). Despite studies may have addressed the same clinical question, they may differ in the demographic characteristics of the included participants and in the implementation of interventions (BORENSTEIN *et al.*, 2009). In order to address these variations across the studies, a meta-analysis should be conducted under the random effects model (BORENSTEIN *et al.*, 2009). The random effects meta-analysis assumes that each study estimates its own treatment effect, which follows a normal distribution (PANESAR, SIOW and ATHANASIOU, 2010).

The DerSimonian and Laird random effects method incorporates the assumption that the different studies are estimating different but yet related treatment effects (PANESAR, SIOW and ATHANASIOU, 2010). This method is based on the inverse variance approach used in the fixed effects model. In the fixed effects model each study is weighted by the inverse of its variance (BORENSTEIN *et al.*, 2009). In the random effects analysis too. However, the difference is that the variance now included the original (within-studies) variance plus the estimate of the between studies variance,  $T^2$  (BORENSTEIN *et al.*, 2009). Under the random effects model, the weight assigned to each study is

$$W_i^* = \frac{\sum_{i=1}^k Y_i W_i^*}{\sum_{i=1}^k W_i^*}$$

Where  $W_i^*$  is

$$W_i^* = \frac{1}{V_{Yi}^*}$$

When there is no heterogeneity among the studies (between studies variance = 0), the DerSimonian and Laird method and the inverse variance-based method on a fixed effects analysis will produce identical results (and thus also give results similar to the Mantel-Haenszel method) (PANESAR, SIOW and ATHANASIOU, 2010). When heterogeneity is present

(between studies variance  $\neq$  0), the confidence intervals of the treatment effect estimate under the DerSimonian and Laird method will be wider when compared with an estimation under a fixed effects methods and, therefore, the claims of a statistical significance will be more conservative (PANESAR, SIOW and ATHANASIOU, 2010).

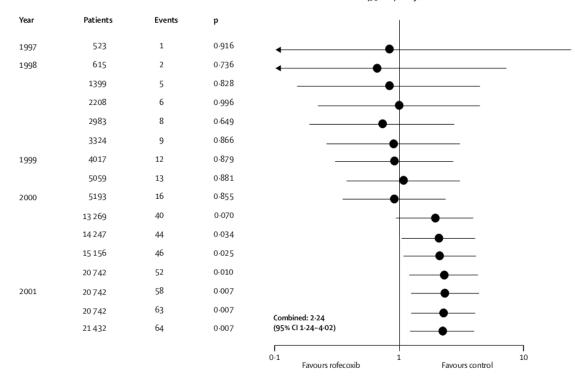

It is common the researchers to conduct sensitivity analyses in order to evaluate the robustness of the meta-analysis' results. It is recommended that both fixed and random effects models should be used in such sensitivity analyses (PANESAR, SIOW and ATHANASIOU, 2010). This gives a picture of the amount of between-studies variance (heterogeneity) influencing the results and helps investigators taking conclusions.

### **I.5.6. CUMULATIVE META-ANALYSIS**

Cumulative meta-analysis is performed by adding studies one by one, until all relevant studies have been included in the analysis (BORENSTEIN *et al.*, 2009). Cumulative meta-analysis is not a different analytical method. It only displays the results the results into a sequence based on some factor and how the estimate of the effect size shifts as a function of such factor (BORENSTEIN *et al.*, 2009). Cumulative meta-analysis is commonly used to displays the effect size estimate over time.

If conducted prospectively, cumulative meta-analyses can be updated every time a new study is published. If conducted based on study size, cumulative meta-analysis allow evaluating how small studies influence the overall result (PANESAR, SIOW and ATHANASIOU, 2010). One should note that if the objective is to assess the relationship between a factor and the estimated effect size, then the most appropriate analysis is the meta-regression.

Figure I.6 displays a forest plot where it is shown the estimated RR and its correspondent 95% confidence interval (CI) of a cumulative meta-analysis of RCTs comparing rofecoxib with control (JÜNI *et al.*, 2004). By 2000, an increased RR for myocardial infarction was already identified (RR 2,30; 1,22 - 4,33, p=0,01). Rofecoxib was withdrawn from market in 2004 due to cardiovascular adverse effects.

Relative risk (95% CI) of myocardial infarction

**Figure I.6** - Cumulative meta-analysis of randomised trials comparing rofecoxib with control (JÜNI *et al.*, 2004).

### I.5.7. META-REGRESSION

Regression can be used to assess a relationship between one or more covariates and a dependent variable (BORENSTEIN *et al.*, 2009). This approach is essentially the same that is used in meta-analysis, except that the covariates are at the level of the study rather than the level of the subject, and the dependent variable is the effect size (e.g.: RR, OR or RD) in the studies rather than subject scores (BORENSTEIN *et al.*, 2009). Using this procedure in metaanalysis is called meta-regression.

Meta-regressions usually differ from simple regressions in two ways (HIGGINS and GREEN, 2011). First, studies with larger sample size have more influence on the relationship than small sample sized studies, since studies are weighted by the precision of their respective effect estimate (HIGGINS and GREEN, 2011). Second, there is a need to assign a weight to each study and to evaluate the existence of between-studies variance (heterogeneity) in order to select the most appropriate model (fixed versus random effects analysis) (BORENSTEIN et al., 2009).

Meta-regression will return a coefficient which is interpreted in relation to an increase or a decrease in the effect size. Borenstein and colleagues give a simple example which will help to understand, using a meta-analysis and a meta-regression conducted by Colditz and colleagues (1994) and Berkey and colleagues (1995), respectively (BORENSTEIN *et al.*, 2009). It is found a coefficient of -0,0292 for a meta-regression evaluating the association between a vaccine to prevent tuberculosis and latitude. The result means that everyone degree of latitude corresponds to a decrease of 0,0292 units in effect size.

Meta-regression has been used to evaluate the existence of heterogeneity between studies and how certain covariates could be responsible for excessive between-studies variance (BAKER et al., 2009). The meta-analysis used as an example by Borenstein and colleagues estimated a RR of 0,650, 95% CI 0,601 to 0,704. The  $l^2$  test for heterogeneity yielded a result of 92,12%, which is excessive. The studies included in the meta-analysis of Colditz and colleagues (1994) estimated RR ranging from 0,198 to 1,562. The meta-regression allowed explaining how the efficacy of the vaccine depended on the latitude.

### I.5.8. HETEROGENEITY

Meta-analysis combines data across studies in order to achieve a summary effect size. The value of a meta-analysis increases when the results of the included studies show important effects of similar magnitude (HIGGINS *et al.*, 2003). However, there are several issues in the process of integrating evidence from studies, in particular when they present conflicting results (HIGGINS *et al.*, 2003; IOANNIDIS, 2008). In order to attempt assessing the consistency between the included studies, reports of meta-analyses commonly present a statistical test for heterogeneity (HIGGINS *et al.*, 2003). The test for heterogeneity aims to determine whether the differences underlying the results of the studies are genuine (heterogeneity), or whether the differences in the findings are related with chance (homogeneity) (HIGGINS *et al.*, 2003). The presence of heterogeneity can also be investigated using plots.

Heterogeneity may arise from differences in study designs, demographic characteristics of the included participants, administration mode, dosage or frequency of the interventions, duration of treatments, or methodological aspects specific to each study, as the outcomes assess procedure (IOANNIDIS, 2008; BORENSTEIN *et al.*, 2009; EUROPEAN MEDICINES AGENCY, 2001; HIGGINS and GREEN, 2011).

### I.5.8.1. Statistical tests to investigate heterogeneity

Commonly used in meta-analysis, the Cochrane' Q statistic test explores the existence of heterogeneity which may be considered significant or not based on a P-value (IOANNIDIS, 2008). Formally, a null hypothesis is formulated stating that all studies share a common effect size and then test this hypothesis (BORENSTEIN *et al.*, 2009). Under the null hypothesis, the Q test follows a  $\chi^2$  distribution with degrees of freedom to *k*-1, setting a P-value for any observed value of Q (BORENSTEIN *et al.*, 2009). It is usual to use a cut-off of 10% for significance, instead of 5%, due to the poor capacity of the Q test to detect true heterogeneity (HIGGINS *et al.*, 2003). However a non-significant result may not be indicative of homogeneity (HIGGINS *et al.*, 2003; BORENSTEIN *et al.*, 2009).

The  $l^2$  statistic test offers a quantitative measure of the heterogeneity, by estimating the percentage of total variation across studies that is due to heterogeneity rather than chance (HIGGINS *et al.*, 2003). It is computed as

$$I^2 = \frac{Q - df}{Q} \times 100$$

where Q is the  $\chi^2$  statistic and *df* is its degrees of freedom. The value of the  $l^2$  statistic test ranges from 0 to 100%.

There is no formal categorization to classify the presence of heterogeneity as excessive or not (HIGGINS *et al.*, 2003). Many authors consider statistical heterogeneity as low when  $0\% < l^2 < 25\%$ , moderate when  $25\% < l^2 < 50\%$  or high when  $l^2 > 50\%$ , although other considerations are accepted (HIGGINS and GREEN, 2011).

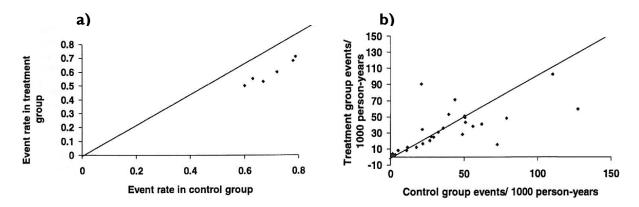

The  $l^2$  statistic test gives us an estimation of the excess of between-studies variance which may influence the meta-analysis' results. However, it should be noted that this test is a descriptive statistic and not an estimate of any underlying quantity (BORENSTEIN *et al.*, 2009).

It should be noted that the model used to conduct the meta-analysis should not be chosen based on the heterogeneity test (BORENSTEIN *et al.*, 2009). In particular conducting two-stage meta-analysis, in which the meta-analytic model (fixed or random effects) is determined by the result of a statistical test. These strategies were found to be potentially misleading (HIGGINS *et al.*, 2003). The meta-analytic model should be chosen based on the investigators' understanding of whether all studies share similar methodological designs and common effect sizes (BORENSTEIN *et al.*, 2009).

### I.5.8.2. Visual investigation of heterogeneity

### I.5.8.2.1. L'Abbé plot

The L'Abbé plot is applicable to meta-analyses of studies with binary outcomes. The event rate in the intervention group (y-axis) is plotted against the event rate in the control group (x-axis) (FERRER, 1998). There is a central line indicating identical risks in each group (BAX et al., 2009). The L'Ábbé plot may also have a regression line indicating the meta-analytic estimated size effect, usually represented by a dotted line (BAX et al., 2009). Sometimes, the dots representing each study can have sizes proportional to the study weights (BAX et al., 2009). If the intervention group has better results than the control group, the dots will be displayed under the central line. In the absence of heterogeneity, the dots study to study (Figure I.7a). However, in the presence of heterogeneity, the dots may be substantially scattered (Figure I.7b).

**Figure 1.7** - L'Abbé plots displaying the results of two meta-analyses, one suggesting lower evidence of between-studies heterogeneity (a) and other suggesting the existence of heterogeneity between the results of the studies (b) (FERRER, 1998).

### I.5.8.2.2. Galbraith plot

In the Galbraith plot, the y-axis will show the effect size divided by its standard error and the x-axis will show the inverse of the standard error (BAX *et al.*, 2009). Like the L'Abbé plot, each study is represented by a single dot. A regression line representing the slope of the meta-analytic estimated size effect based on the fixed-effects model runs centrally (BAX et al., 2009). Parallel to the regression line, two lines limit a 95% confidence interval in which most dots would be expected to fall (BAX et al., 2009). These two lines are separated by a 2-standard deviation distance from the regression line. The distance between the dots and the regression line represents the extent in which each study contributes to the heterogeneity. Studies located outside the limits will be trials where the 95% confidence interval does not contain the pooled estimate and, therefore, may contribute to the excess of heterogeneity (BAX et al., 2009). In the absence of heterogeneity it is expected that all studies will fall inside the 95% confidence interval limit. Figure 1.8 represents a Galbraith plot where several points are located outside the limits, representing studies that may contribute to excessive heterogeneity.

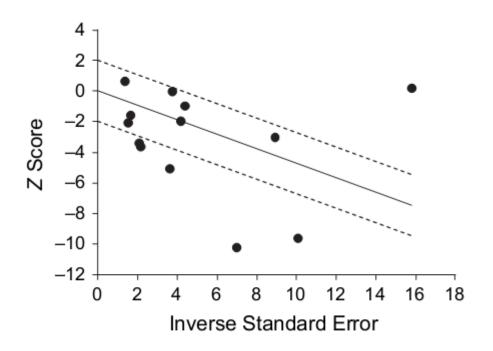

Figure I.8 - Galbraith plot (BAX et al., 2009).

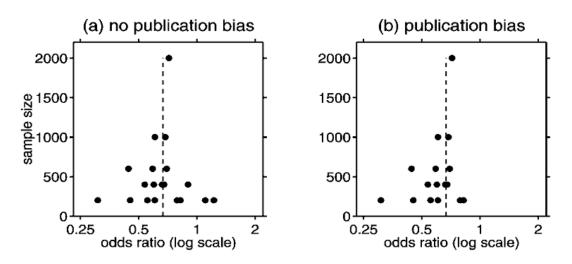

### **I.5.9. PUBLICATION BIAS**

Publication bias occurs when the studies selected to be included in a meta-analysis or systematic review do not represent all studies on the topic of interest (MACASKILL, WALTER and IRWIG, 2001). If the studies are a biased sample of the existent evidence, then the estimated effect sized will reflect this bias (BORENSTEIN *et al.*, 2009). Theoretically, the literature search conducted would be able to identify all the relevant studies addressing the

same research issue. However, this may not be possible and even with existing electronic search tools some studies fitting the inclusion criteria may escape (BORENSTEIN *et al.*, 2009). Moreover, studies with statistically significant positive results are more likely to be highlighted and easily published (MACASKILL, WALTER and IRWIG, 2001). This may induce bias in publish literature and subsequently induce bias in systematic reviews and meta-analysis (BORENSTEIN *et al.*, 2009). Other sources of bias that can affect effect sizes estimates in meta-analysis are the inclusion of studies written in specific languages or the search of a particular type databases or journals (BORENSTEIN *et al.*, 2009). Herein is described some tools which help researchers to evaluate the presence of publication bias in meta-analysis.

### I.5.9.1. Funnel plot

The visual inspection of a funnel plot is one of the most common methods used to detect publication bias. The funnel plot is plotted with effect size on the X axis and the sample size or variance (or standard error) on the Y axis (BORENSTEIN *et al.*, 2009; MACASKILL, WALTER and IRWIG, 2001). The plot is expected to take a shape of a funnel in the absence of publication bias, with the amount of scatter about the true effect (a vertical line of symmetry) decreasing with increasing sample size or, if this is the case, with decreasing of standard error (MACASKILL, WALTER and IRWIG, 2001). Large studies appear located toward the top of the graph and generally near the line representing the mean effect size (BORENSTEIN *et al.*, 2009). Smaller studies tend to appear in the bottom of the graph and are usually spread across a broad range of values (BORENSTEIN *et al.*, 2009). Figure 1.9 represents two funnel plots of different meta-analyses, one where publication bias was not detected (Figure 1.9a) and other funnel plot suggesting the presence of publication bias (Figure 1.9b) (MACASKILL, WALTER and IRWIG, 2001).

**Figure 1.9** - Funnel plots based on simulation of meta-analyses, one where publication bias was not detected (a) and other where publication bias was present (b) (MACASKILL, WALTER AND IRWIG, 2001).

Since the interpretation of funnel plots is subjective, other tests have been suggested to test the presence of publication bias (BORENSTEIN *et al.*, 2009).

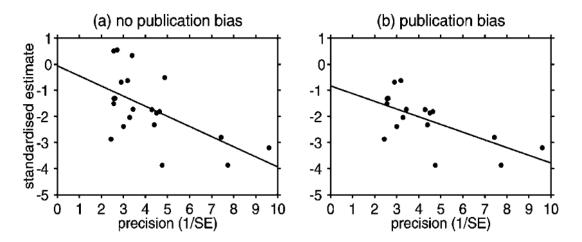

### I.5.9.2. Begg and Mazumdar rank correlation test

The Begg and Mazumdar rank correlation test assesses the significance of the correlation between the effect size estimates and the meta-analysis weights (DEEKS, MACASKILL and IRWIG, 2005). The test involves standardizing the effect size estimates to stabilize the variances (dividing each estimate by the standard errors) and performing an adjusted rank correlation test based on Kendall's tau (DEEKS, MACASKILL and IRWIG, 2005). However, this test has shown to have low power when the meta-analysis includes few studies.

### **I.5.9.3. Egger regression test**

One of the most used tests to evaluate the presence of publication bias is the Egger regression test. The Egger regression test assesses the funnel plot asymmetry based on a regression of the standardized effect size estimates and a precision estimate (standard error), testing whether the intercept deviates from zero (DEEKS, MACASKILL and IRWIG, 2005). As an example, when outcomes are dichotomous, and intervention effects are

expressed as ORs, this approach corresponds to a linear regression of the log OR on its standard error, weighted by the inverse of the variance of the log OR (HIGGINS and GREEN, 2011). When no publication bias is present, the intercept will pass through the origin (expected value of zero) and the slope will be an unbiased estimate of the true (underlying) effect (MACASKILL, WALTER and IRWIG, 2001). On the other hand, if publication bias is present, the fitted line will not pass through the origin (MACASKILL, WALTER and IRWIG, 2001). The size of the intercept is taken as the basis of a test for publication bias. Figure I.10 presents the results of the Egger regression test, in the presence (Figure I.10a) and in the absence (Figure I.10b) of publication bias, respectively.

**Figure 1.10** - Plots showing Egger's regression test results, one where publication bias was not detected (a) and other where publication bias was present (b) (MACASKILL, WALTER and IRWIG, 2001).

# I.6. THE POSTMARKETING DRUG RISK ASSESSMENT

### **I.6.1. THE BENEFIT-RISK ASSESSMENT PROCESS**

The benefit-risk ratio assessment can be defined as the consideration of whether a drug, when prescribed or indicated to treat a specific condition, is worth the risk to the patient as compared with possible benefits. The benefit-risk ratio is evaluated in the context of two dimensions (CURTIN and SCHULZ, 2011). The dimension of benefits is measure in terms of clinical efficacy, which is the successful treatment of prevention of the condition for which the drug is being indicated or the improvement of the patients' quality of life. The observed ADRs and potential risk for unanticipated ADRs consist in the dimension of the risk. To receive market authorisation, a drug is evaluated on the basis of scientific criteria of quality, safety and efficacy for its intended use (US FOOD AND DRUG ADMINISTRATION, 2013). The assessment of the benefit-risk relation should be based on the available RCTs designed to determine the efficacy and safety of the drug when used in the intended therapeutic indication (EUROPEAN MEDICINES AGENCY, 2007). Since all drugs have the ability to cause adverse effects, a drug is considered "safe" if its benefits outweigh its risks (US FOOD AND DRUG ADMINISTRATION, 2013).

The assessment of a drug's benefit-risk ratio by a regulatory authority is essentially a qualitative procedure and relies heavily on expert panels committees' opinions (CURTIN and SCHULZ, 2011). However, the information about the drug can be somehow limited and may not address all relevant questions, introducing uncertainties in the decision-making process (US FOOD AND DRUG ADMINISTRATION, 2013). Two experts may agree on the evidence supporting the efficacy of a certain drug, they may have different opinions regarding the safety profile; one expert may say it is worthwhile to have the drug in market while other may just recognize its value where other drugs have failed. The subjectivity of the benefitrisk ratio assessment process takes into account the severity of the condition being treated, the population being treated, the effectiveness of the available treatments, the nature and severity of a specific AE as well as other factors (US FOOD AND DRUG ADMINISTRATION, 2013; MADRE et al., 2006; DAL PAN and ARLETT, 2012). No method proves fully satisfactory solution regarding the benefit-risk ratio assessment, since it is difficult to reduce a multidimensional procedure to straightforward decisions (CURTIN and SCHULZ, 2011). The FDA and EMA do not use quantitative tools to conduct benefit-risk ratio assessments. Both agencies produced guidance for assessors in order to promote the transparency of the

Chapter I

decision process (US FOOD AND DRUG ADMINISTRATION, 2013; EUROPEAN MEDICINES AGENCY, 2007). However, the need to further research in methodologies for quantitatively assess medical interventions benefit-risk ratio has been recognized (EUROPEAN MEDICINES AGENCY, 2007).

The benefit-risk ratio assessment is a continuing procedure, starting during the drug's preclinical development and continuing during the marketing period. Results from animal models determine if a drug is candidate to be administered in humans to continue further clinical evaluation (CURTIN and SCHULZ, 2011). The dynamic nature of this process is due to new findings that can arise in every phase of drug life cycle. Unknown adverse reactions can lead drugs withdrawal from market. FDA withdrawn natalizumab in 2005 after being associated with progressive multifocal leukoencephalopathy (CURTIN and SCHULZ, 2011). However, is was remarketed in 2006 since it was recognized that natalizumab improved multiple sclerosis patients' quality of life and was more effective than the therapeutic alternatives approved at that time (US FOOD AND DRUG ADMINISTRATION, 2013). Thalidomide was also relauched to treat multiple myeloma and erythema nodosum leprosum (CURTIN and SCHULZ, 2011).

The removal of a drug from market after being associated with a rare and serious ADR has a major impact in society, since patients have become exposed to such risk. Therefore, on the interest of the public health, regulatory science has a critical role in the management of drug risk assessment during the postmarketing phase of a drug.

### **I.6.2.** THE ASSESSMENT OF RISK DURING THE DRUGS' POSTMARKETING PHASE

During the clinical development phase, no more than hundreds or few thousands of patients are exposed to a drug. After receiving a market authorisation, a larger and more varied population will receive the medication (STAFFA and DAL PAN, 2012). The knowledge about the benefit-risk ratio of a drug increases with the everyday practice, since unknown rare and/or long-latency ADRs may occur after prolonged use, as well as those occurring in patients with comorbidities and interactions with other co-prescribed medicines (MADRE et *al.*, 2006). This additional knowledge of drugs' safety profile is subject of carefully evaluation by regulatory authorities.

The postmarket drug risk assessment can be segmented in three stages: the evidence generation, the evidence interpretation and integration, and the decision-making process (Figure I.II) (HAMMAD *et al.*, 2013). Safety signals can be generated from more than one

evidence source, like spontaneously reported ADRs, RCTs, observational studies or metaanalyses (LESTER *et al.*, 2013). Each source of evidence is then assessed as its methodological quality. Regulatory authorities may require further studies to be conducted in order to clarify the potential risks of harm hypothesized by the safety signal.

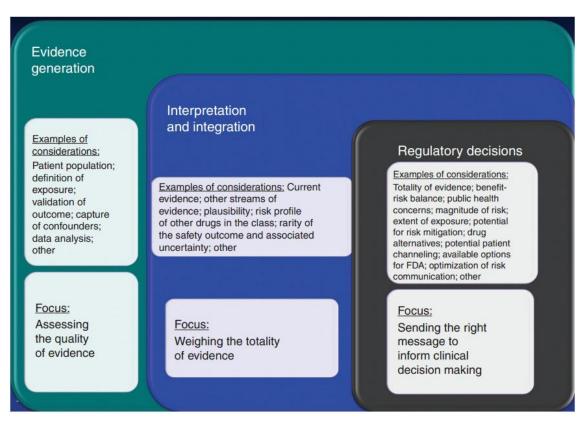

Figure I.II - Dimensions of postmarket drug safety assessment (HAMMAD et al., 2013).

The second dimension involves weighting the contribution of each data source which supports the safety signal and to assess the level of residual uncertainty concerning the risks at the time of evaluation. For this, the causal association between the AE and the suspected drug should be assessed. The Bradford Hill's criteria, decisional algorithms and guidelines to rate evidence may be consulted by regulatory authorities in order to better interpret the available evidence (HILL, 1965; GUYATT *et al.*, 2008). Hierarchize the evidence based on the study design may be helpful (MADRE *et al.*, 2006). Descriptive studies, such case reports, case series and uncontrolled cohorts, limit the inferences that are made about causality since they are mainly used as hypothesis generating. By including a comparator group, analytic studies like RCTs, cohort or case-control, allow confirming research hypotheses and are placed in higher levels of evidence hierarchy scales (MADRE *et al.*, 2006; STROM, 2012). The amount and diversity of data sources available depends on the nature of the harm being evaluated, as well

as on the specific demographic characteristics of the population receiving treatment. Serious and rare AEs with acute onset are more likely to be spontaneously reported, an example being rhabdomyolysis associated with cerivastatin (CHANG *et al.*, 2004). In fact, since rhabdomyolysis is a rare event, spontaneously reported cases were the only data evidence on this drug-adverse effect pair (STAFFA, CHANG and GREEN, 2002). The risk for long-latency AE is better reflected in longitudinal, observational epidemiologic studies, as it was for bone fractures and proton pump inhibitors (YANG *et al.*, 2006; TARGOWNIK *et al.*, 2008).

The decision taken by the regulatory authority addressing the safety issue is considered the third dimension. The regulatory action is taken considering the entire benefit-risk relation of the drug and not only the new knowledge about the safety profile. The therapeutic position of the drug in relation to other therapeutic alternatives, the severity of the condition for which the drug is being indicated and the potential impact of the risk minimization strategies are taken into account in this stage (HAMMAD *et al.*, 2013).

The need for improvement in the regulatory science has been subject of debate. The Innovative Medicines Initiative has several projects ongoing aim to enhance the safety monitoring of drug to better support benefit-risk ratio evaluations (GOLDMAN, 2012). Since the evidence on safety issues can be generated from a diversity of sources, methods to integrate multiple studies continue to be developed (HAMMAD et al., 2013).

### **I.6.3. COMBINE EVIDENCE ON HARMS FROM DIFFERENT DATA SOURCES**

The decision-making process requires the best evidence on benefits and harms about an intervention. The methodological quality of clinical development programmes have improved over the last years (VANDENBROUCKE, 2004; SCHULZ *et al.*, 2010). At the time to grant a license to a drug, regulatory authorities are in possession of a considerable volume of knowledge about its benefit-risk profile. Nonetheless, most evidence on harms from a medical intervention is obtained from observational research since it reaches the market (VANDENBROUCKE, 2006).

Clinical trials are considered to provide the strongest evidence of efficacy regarding an intervention (LESKO and MITCHELL, 2012; PAPANIKOLAOU, CHRISTIDI and IOANNIDIS, 2006). The random assignment allows having comparable groups of patients and the applying statistics to explore data on the basis of random sampling (VANDENBROUCKE, 2004). This provides better control against bias than other study designs. The sample size of a RCT is powered to test differences between groups regarding an efficacy outcome. However, most of RCTs are too small and don't have enough follow-up time to detect AEs that fewer than about one per 200/year or taking longer than one or two year to develop (VANDENBROUCKE, 2004). Yet, RCTs provide accurate information on the most common and acute AEs (LESKO and MITCHELL, 2012; VANDENBROUCKE and PSATY, 2008).

To evaluate rare and long-term AEs, longitudinal comparative observational studies such case-controls and population based cohorts are needed (STROM 2006; PAPANIKOLAOU, CHRISTIDI and IOANNIDIS, 2006; VANDENBROUCKE, 2006). Large-scale observational studies may be devoted to study specific AEs, unlike RCTs which may report fragmented pieces of evidence on harms which may deserve further investigation (PAPANIKOLAOU, CHRISTIDI and IOANNIDIS, 2006). The strict inclusion/exclusion criteria of RCTs usually exclude subgroups of patients, such as pregnant women, children, or elderly patients with or without comorbidities (MADRE *et al.*, 2006). Once in the market, observational studies are the most appropriate ones to study the medicines' safety profile since they may reflect better the nature and the frequency of AEs experienced by patients in clinical practice.

The decision-making process, whenever a physician intends to prescribe a drug in his clinical daily practice or when a regulatory authority decides to carry out a benefit-risk ratio assessment process, should combine information on the best evidence of benefits and harms (VANDENBROUCKE and PSATY, 2008). Clinical trials may constitute the most authoritative source of evidence for benefits. To evaluate safety issues, however, it is suggested that both experimental and observational evidence should be considered (VANDENBROUCKE and PSATY, 2008; AGENCY FOR HEALTHCARE RESEARCH AND QUALITY, 2014). Agency for Healthcare Research and Quality guidance on Effectiveness and Comparative Effectiveness Reviews recommends investigators to include both RCTs and observational studies aiming to assess harms when comparing medical interventions (AGENCY FOR HEALTHCARE RESEARCH AND QUALITY, 2014). Cochrane Handbook for Systematic Reviews of Interventions refers to the inclusion of nonrandomized and randomized trials when assessing adverse effects. It is strongly recommended investigators should make any attempt to combine evidence from experimental and observational data. A study conducted to assess how information about AEs is included in systematic reviews found that most of Cochrane reviews rely only on data from RCTs (HOPEWELL, WOLFENDEN and CLARKE, 2008).

Incorporate data on AEs from different sources in a systematic review process is challenging and requires proper assessment of their internal validity and possible sources of heterogeneity, as well as the necessary methods of analysis (CHOU and HELFAND, 2005). Such methodological issues are extended to meta-analysis when this methodology is

considered to integrate data from both experimental and observational studies. Criteria on how meta-analysis technique could be used to combine available information from both RCTs and observational studies in order to evaluate safety issues has been debated (COUNCIL FOR INTERNATIONAL ORGANIZATIONS OF MEDICAL SCIENCES, 2013).

## **I.7. OBJECTIVES OF THIS THESIS**

The meta-analytic technique can be useful as a Pharmacovigilance method to systematically evaluate emerging data on pharmacological interventions' safety profile during their development, licensing and subsequent launch onto the healthcare market. Therefore, the primary objective of this project is to identify the role of meta-analysis as a Pharmacovigilance approach and to evaluate how best to combine safety information from both experimental and observational studies through this statistical technique.

The specific objectives outlined for this project were the following:

- To perform a systematic review aiming at identifying meta-analyses from both experimental and observational studies where safety was found to be a primary outcome measure.
- 2) To conduct a meta-analyses aiming at evaluating the risk of a frequent adverse event by pooling data from RCTs, and to explore the between-studies heterogeneity.
- 3) To conduct a meta-analyses aiming at evaluating the risk of a rare adverse event by pooling data from both experimental and observational studies, and to explore the between studies heterogeneity.
- 4) To identify the data sources supporting benefit/risk ratio reevaluations conducted by regulatory authorities on safety issues.
- 5) To evaluate how risk estimates generated from cumulative meta-analysis performs over time for drugs having their benefit/risk ratio reevaluated due to safety issues and, additionally, compare the risk estimates with regulatory authorities' conclusions.

To fullfil point 1), the study entitled "Data sources on drug safety evaluation: a review of recent published meta-analyses" was conducted (ALVES, BATEL MARQUES AND MACEDO, 2012a); to fullfil point 2), the study entitled "Apixaban and Rivaroxaban Safety After Hip and Knee Arthroplasty: A Meta-Analysis" was conducted (ALVES, BATEL MARQUES AND MACEDO, 2012b); to fullfil point 3), the study entitled "A meta-analysis of serious adverse events

Chapter I

reported with exenatide and liraglutide: Acute pancreatitis and cancer" was conducted (ALVES, BATEL MARQUES AND MACEDO, 2012c); to fullfil point 4), the study entitled "Sources of information used by regulatory agencies on the generation of drug safety alerts" was conducted (ALVES, MACEDO AND BATEL MARQUES, 2013); to fullfil point 5), the study entitled "Drug-safety alerts issued by regulatory authorities: usefulness of meta-analysis in predicting risks earlier" was conducted (ALVES, BATEL MARQUES, AND MACEDO, 2014).

**META-ANALYSES** 

II. DATA SOURCES ON DRUG SAFETY EVALUATION: A REVIEW OF RECENT PUBLISHED META-ANALYSES

### II.I. ABSTRACT

Meta-analysis is a quantitative approach to summarize the findings from several studies and has been applied with increasing frequency to RCTs. Because of their sample size and duration limitations, experimental studies could not be able to detect late or rare AEs, which may be identified in well-designed observational studies. This study aims to identify and analyze meta-analyses from both experimental and observational studies where safety was found to be an outcome measure. The meta-analyses inclusion criteria was established as at least one AE as primary outcome. Safety outcomes were considered as the increase in the risk for an AE after a pharmacological intervention. A MEDLINE search for metaanalyses published in the New England Journal of Medicine, The Lancet, Journal of American Medical Association, British Medical Journal, Annals of Internal Medicine, PLoS Medicine, Annual Review of Medicine, and Archives of Internal Medicine, between October 2005 and September 2010, was carried out. Sixty meta-analyses met the inclusion criteria. Of these, 53 included only experimental studies, 4 included both experimental and observational studies, and 2 included only observational studies. Of the 6 meta-analyses that included observational studies, 4 included cohort and case-control studies, and 2 included cohort, case-control, and cross-sectional studies. One meta-analysis did not report the type of studies included. Experimental studies were found to be the main source of meta-analyses on drug safety. The role of meta-analyses in pharmacovigilance is a matter of ongoing debate, and efforts are being made to develop guidelines on the use of meta-analysis in drug safety assessments, to better combine evidence about harms.

## **II.2. INTRODUCTION**

Medicine use is a fundamental component of health care, and the optimization of drug prescribing has become an important public health problem worldwide (BATES, 1995; AKICI and OKTA, 2007). It is now becoming clear that, to assess the overall effect of medical interventions, adverse effects should be reviewed with similar rigour as therapeutic benefits (HOPEWELL, WOLFENDEN and CLARKE, 2008; CANONICO et al., 2008; HICKS et al., 2008).

Meta-analysis is a systematic approach to identify, synthesize, and combine the results of selected studies (DERSIMONIAN and LAIRD, 1986; KIM and BERLIN, 2006). It is used to identify sources of variation among study findings and to provide an overall measure of effect to reach conclusions about a body of research. The meta-analytic technique has been applied with increasing frequency to RCTs, which are considered to provide the strongest evidence of efficacy regarding an intervention (STROM, 2006; VANDENBROUCKE, 2004a). This is due to the fact that randomized controlled designs have better control and protection against bias than other study designs.

However, evidence on AEs reported by RCTs can be considered insufficient at some point (VANDENBROUCKE and PSATY, 2008; IOANNIDIS *et al.*, 2004). Clinical trials are able to identify the most frequent and common AEs that occurred during the intervention administration (MADRE *et al.*, 2006). However, given the relatively small sample size, their average duration, and the homogeneity of the studied population, RCTs are less likely to detect rare or long-term AEs (IOANNIDIS and LAU, 2001; VANDENBROUCKE, 2004b).

Data from observational studies can be helpful to evaluate the safety of an intervention (LOKE, DERRY and ARONSON, 2004). In some situations, the best evidence regarding the safety of minority or underrepresented populations in RCTs, such as pregnant women, children, and elderly patients with or without comorbidities, is provided from observational studies (MADRE *et al.*, 2006; ROTHWELL, 2005). The observational designs may reflect better the nature and the frequency of AEs experienced by patients in clinical practice, especially rare or late AEs (PAPANIKOLAOU, CHRISTIDI and IOANNIDIS, 2006).

The investigation of uncommon or long-term AEs associated with pharmacological interventions is an important application of meta-analysis. The use of meta-analysis to integrate data from different study designs can be affected by inherent biases of the considered studies (KIM and BERLIN, 2006). This study aims to identify and analyze meta-analyses from both experimental and observational studies where safety was found to be an

outcome measure in the highest ranked general/internal medicine journals, which are more likely to influence clinicians' perceptions on medicines benefit/risk ratios.

## **II.3. METHODS**

An electronic search was carried out in MEDLINE to identify all the meta-analyses published over a period of 5 years (October 2005 to September 2010) in the New England Journal of Medicine, The Lancet, Journal of American Medical Association (JAMA), British Medical Journal (BMJ), Annals of Internal Medicine, PLoS Medicine, Annual Review of Medicine, and Archives of Internal Medicine. These journals were selected according to their impact factor. They are the eight higher ranked journals in the category of "general and/or internal medicine", according to the Science Citation Index (THOMPSON REUTERS, 2014). Search was limited to meta-analyses. The search strategy is listed in the Supplemental Data 11.1.

Two researchers independently screened by hand the titles and abstracts and selected full papers for inclusion. Discrepancies were resolved by consensus involving a third investigator. Meta-analyses were included if they meet the following inclusion criteria: (i) to assess the risk for the occurrence of at least one AE related to a pharmacological intervention as a primary outcome; and (ii) to pool the results using the meta-analytic technique. Meta-analyses combining study summary results and meta-analyses combining individual patient data were eligible for inclusion. We considered drugs or medical devices eluting drugs as pharmacological interventions. An AE is de fined as "any untoward medical occurrence in a patient or clinical investigation subject administered a pharmaceutical product and which does not necessarily have to have a causal relationship with this treatment" (EUROPEAN MEDICINES AGENCY, 1995). For the purpose of the study, safety outcomes were considered as the increase in the risk for at least one AE after a pharmacological intervention. Therefore, we restricted the study to meta-analysis of increased risk for an AE because when an AE is lower on treatment than on control, which is still an AE but also may constitute an efficacy end-point. Meta-analyses that evaluated efficacy outcomes besides safety out-comes were included if the risk for the occurrence of any AE was a primary outcome.

The following information from each meta-analysis was extracted: (i) nature of the intervention; (ii) outcomes assessed – one specific or several; (iii) resources searched and if the search strategy was reported or not; (iv) type of meta-analysis design – safety and/or efficacy; (v) type of studies included and their publication status; (vi) assessment of publication bias; (vii) methodological quality assessment of the included studies; and (viii) use of meta-analysis reporting guidelines. Additionally, for meta-analyses that included both

108

experimental and observational studies, we evaluated if the pooled results were different and, if so, in which direction.

Meta-analyses that evaluated the same clinical question were analyzed. Two metaanalyses were considered to be evaluating the same clinical question when, for a common study aim, they assessed the same safety out-come for the same pharmacological intervention. For those meta-analyses, we extracted information on the following: pharmacological intervention(s) assessed, common outcome(s) evaluated, type of studies included as data sources, and statistical analysis method used. The results of meta-analysis assessing the same clinical question were described and, if different, in which direction. Differences in the choice of the meta-analytic method between meta-analyses, which evaluated the same clinical question, were presented.

The pharmacological interventions were coded according to Anatomical Therapeutic Chemical (ATC) classification system, second-level therapeutic subgroup (WHO COLLABORATION CENTRE FOR DRUG STATISTICS METHODOLOGY, 2014). The AEs, which were established as meta-analyses' primary outcomes were classified according to the Medical Dictionary for Regulatory Activities (MedDRA), high-level group term (HLGT) (MEDICAL DICTIONARY FOR REGULATORY ACTIVITIES, 2011).

## **II.4. RESULTS**

The initial search yielded 459 citations. Twenty-one articles were excluded because they were not meta-analyses, resulting in 438 full papers identified as "possibly eligible" for inclusion. After reviewing the full publication, 60 meta-analyses were included in the study (Figure II.1) (Supplemental Data II.2).

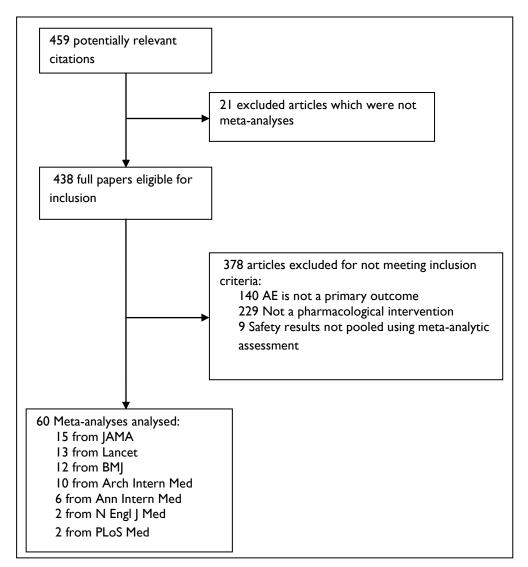

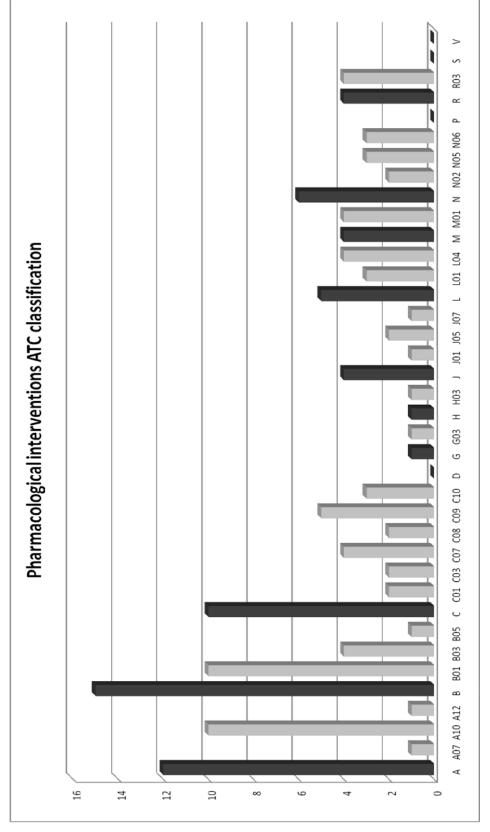

Figure II.1 - Flow diagram of identification of meta-analyses for inclusion.

Of the 60 included meta-analyses, 15 (25%) were published in the JAMA, 13 (22%) in The Lancet, 12 (20%) in the BMJ, 10 (17%) in the Archives of Internal Medicine, 6 (10%) in the Annals of Internal Medicine, 2 (3%) in the New England Journal of Medicine, and another 2 (3%) in the PLoS Medicine. We did not identify any meta-analysis published in the Annual Review of Medicine throughout the studied period.

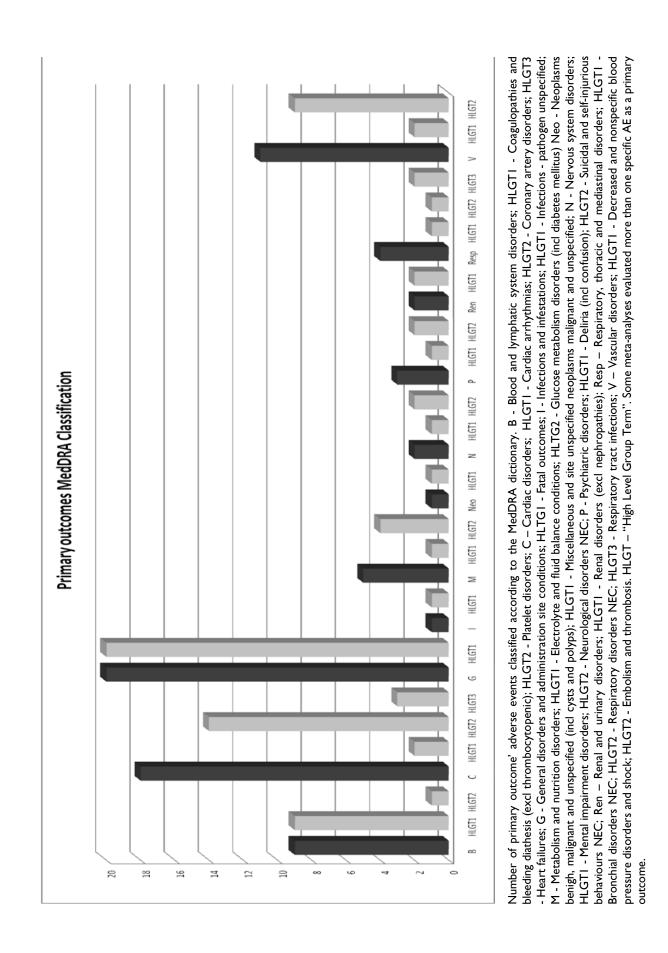

Meta-analyses were mainly directed toward evaluation of pre-specified adverse outcomes of interest (n=48; 80%). Twelve (20%) meta-analyses assessed the whole spectrum of AEs. Of the 60 included studies, 3 (5%) assessed the AEs associated with medical devices eluting drugs. The pharmacological intervention classification according to therapeutic subgroup of the ATC code is presented in Figure II.2. The most frequently assessed pharmacological interventions were "antithrombotic agents" (n=10) and "drugs used in diabetes" (n=10). The AEs of antihypertensive agents, such as "agents acting on the reninangiotensin system" (n=5), "beta blocking agents" (n=4), "calcium channel blockers" (n=2), and "diuretics" (n=2), also were assessed. One meta-analysis simultaneously assessed AEs of three different pharmacological interventions.

The classification of pre-specified AEs (primary outcome) established according to HLGT MedDRA dictionary is presented in Figure II.3 (48 meta-analyses). The most frequently evaluated AE was "fatal outcomes" (n=20), such as all-cause death outcomes. "Coronary artery disorders", such as myocardial infarction, were the second most frequently evaluated AE (n=14). Risk for occurrence of "coagulopathies and bleeding diathesis (excl thrombocytopenic)", such as bleeding events, and the "embolism and thrombosis", such as stroke or venous thromboembolism, were evaluated by nine meta-analyses. Some meta-analyses evaluated more than one specific AE as primary outcome.

Number of pharmacological interventions according to therapeutic subgroup ATC classification. A - Alimentary tract and metabolism; A07 - Antidiarrheals, intestinal therapy; J - Antiinfectives for systemic use; J01 - Antibacterials for systemi0c use; J05 - Antivirals for systemic use; J07 - Vaccines; L - Antineoplastic and Antianemic preparations; B05 - Blood substitutes and perfusion solutions; C - Cardiovascular system; C01 - Cardiac therapy; C03 - Diuretics; C07 - Beta blocking agents; C08 - Calcium channel blockers; C09 - Agents acting on the renin-angiotensin system; C10 - Lipid modifying agents; D - Dermatologicals; G - Genito urinary system and sex hormones; G03 - Sex hormones and modulators of the genital system; H - Systemic hormonal preparations, excluding sex hormones and insulins; H03 - Thyroid immunomodulating agent; L01 - Antineoplastic agents; L04 - Immunosuppressants; M - Musculo-skeletal system; M01 - Antiinflammatory and antirheumatic products; N antiinflammatory/antiinfective agents; A10 - Drugs used in diabetes; A12 - Mineral supplements; B - Blood and blood forming organs; B01 - Antithrombotic agents; B03 Nervous system; N02 - Analgesics; N05 - Psycholeptics; N06 - Psychoanaleptics; P - Antiparasitic products, insecticides and repellents; R - Respiratory system; R03 Drugs for obstructive airway diseases; S - Sensory organs; V – Various. Some meta-analyses evaluated more than one pharmacological intervention.

**Figure II.3** - Meta-analyses adverse events' primary outcome(s) classification according to the MedDRA dictionary, High Level Group Term (HLGT).

## **II.4.1. EVALUATION OF THE SAME CLINICAL QUESTIONS**

Some meta-analyses addressed the same clinical question. In Table II.1, research questions and studied interventions are presented. According to the results, nine clinical questions were evaluated by more than one meta-analysis. All but one meta-analysis included RCTs. Four meta-analysis studied cardiovascular risk associated with rosiglitazone (all RCTs), two studied major bleeding associated with antithrombotic agents (all RCTs), four studied death from all causes associated with erythropoiesis-stimulating agents (all RCTs), three studied death from all causes associated with drug-eluting stents with sirolimus (all RCTs), two studied myocardial infarction associated with non-steroid anti-inflammatory drugs (on included RCTs and other observational studies), two studied suicidal behavior associated with antidepressants (all RCTs), and two studied pneumonia associated with inhaled corticosteroids (all RCTs).

## II.4.1.1. Statistical meta-analytic methods

We compared the statistical methodology for meta-analyses, which addressed the same clinical question. To prevent biased analysis, the majority of meta-analyses compared the results obtained from two meta-analytic methodologies (random or fixed effects models). Not all the meta-analyses, which evaluated the same clinical question, used the same meta-analytic methods. The meta-analytic methodology choice was discussed in all meta-analyses.

For the majority of the meta-analyses, the choice between a fixed effects model and a random effects model was based on the presence of heterogeneity. When between-study heterogeneity was not observed, the authors used a fixed effects model.

#### **II.4.2. DATA SOURCES AND SEARCH STRATEGY**

Nearly all the meta-analyses (n=57; 95%) searched electronic databases (median 3; range, 1-7), with a total of 19 different electronic databases reported (Table II.2). MEDLINE was the electronic database most frequently searched in meta-analyses (n=51/57; 89%), followed by Cochrane Library (n=47/57; 82%), and EMBASE (n=37/57; 65%). One meta-analysis did not report which electronic databases were searched. Of the 57 meta-analyses that searched electronic databases, 13 (23%) meta-analyses completely specified the search strategy. Twenty-four meta-analyses (42%) reported the use of medical subject headings in their search strategies.

Forty-nine (82%) meta-analyses searched at least one additional data source, besides electronic databases, such as retrieved trials (n=34/49; 70%) or references from reviews (n=24/49; 49%). Other additional data sources were the contact with the manufacturer company (n=21/49; 43%), data from scientific societies meetings (n=17/49; 35%) and contact with the regulatory agencies (n=17/49; 35%), and relevant websites, such as clinicaltrials.gov (n=14/49; 29%).

#### **II.4.3.** Type of studies included in meta-analysis and analysis of results

Of the meta-analyses included in this study, 25 (42%) assessed both efficacy and safety outcomes, whereas 35 (58%) assessed only safety outcomes (Table II.3). Twenty-four (96%) of the meta-analyses assessing efficacy and safety included only experimental studies (RCTs), and I (4%) meta-analysis included both experimental and observational studies (RCTs, non-RCTs, prospective cohort, retrospective cohort, case-control, and cross-sectional studies).

**Table II.3** - Meta-analyses design, type of included studies and their publication status, and assessment of publication bias.

|                                        | n  | =60        |
|----------------------------------------|----|------------|
| Type of study design                   | -  |            |

| Published                              | 31 | 52%        |
| Published and Unpublished              | 21 | 35%        |
| Published and Short communications     | 8  | 13%        |
| Publication Bias                       |    |            |
| Assessed                               | 25 | 42%        |
| Not assessed                           | 35 | 58%        |

Of the meta-analyses that assessed safety outcomes, 29 (83%) included only experimental studies (RCTs), 3 (9%) included both experimental and observational studies, 2 (6%) included only observational studies, and 1 (3%) did not report the design of the studies. Of the three meta-analyses that comprised experimental and observational studies, one included RCTs, *post hoc* analysis within an RCT, and prospective and retrospective cohort studies; 1 included RCTs and prospective and retrospective cohort studies; and 1 included RCTs, prospective cohort, and case-control studies. Of the 2 meta-analyses that comprised

only observational studies, one included prospective cohort and case-control studies, and the other one included prospective cohort, case-control, and cross-sectional studies.

According to the publication status, 31 (52%) meta-analyses included only published studies, 21 (35%) included published and unpublished studies, and 8 (13 %) meta-analyses included published studies and short communications (Table II.3).

Less than half (n=25; 42%) of the meta-analyses reported publication bias assessment.

#### II.4.3.1. Meta-analyses which included different types of studies

Of the four meta-analyses that comprised experimental and observational studies, we evaluated if the pooled results were different and, if so, in which direction. Two meta-analyses compared the results pooled from RCTs with the results pooled from observational studies. Of these, in one meta-analysis, the RCTs' pooled OR of harms overlapped the OR pooled from observational studies. In the other, for one safety outcome (discontinuation of the drug due to AEs, mainly because of cough) the observational studies' pooled OR was beyond chance comparing with RCTs' pooled OR.

Two meta-analyses did not compare the results pooled from RCTs with the results pooled from observational studies. In one of these, observational studies provided information on safety outcomes, which were not reported in RCTs.

#### **II.4.4. QUALITY ASSESSMENT OF THE STUDIES INCLUDED IN META-ANALYSES**

Forty-one (68%) meta-analyses reported the quality assessment of the included studies, of which, 30 (73%) were based on published quality assessment instruments (Table II.4). Twelve different instruments were used to assess methodological quality of RCTs. Of these, Jadad scale (n=10; 24%) and the Cochrane Handbook f or Systematic Reviews of Interventions (n=6; 15%) were the most frequently used (JADAD *et al.*, 1996; HIGGINS and GREEN, 2011). Four meta-analyses assessed the quality of observational studies included, two using the method of Downs and Black (n=2; 5%), one using the Newcastle-Ottawa Scale (n=1; 2%), and the other based its assessment on MOOSE guidelines (n=1; 2%) (DOWNS and BLACK, 1998; WELLS *et al.*, 2011; STROUP *et al.*, 2000). Five meta-analyses assessed the methodological quality of the included studies according to more than one quality assessment instrument. The remaining 11 (27%) meta-analyses did not report the use of

instruments to assess the methodological quality of the included studies. Instead, they described the indicators used for quality assessment.

 Table II.4 - Quality assessment of the studies included in meta-analyses.

Of the 41 meta-analyses that assessed the methodological quality of the studies, 35 (85%) reported the results of this assessment. Nine (22%) meta-analyses evaluated the effect of the different quality scored studies on the results, by performing a sensitivity analysis. The methodological quality assessment was used as inclusion criterion in seven (17%) meta-analyses, of which, three used the Cochrane Handbook for Systematic reviews of Interventions to assess the quality reporting of AEs reported (LOKE, PRICE and HERXHEIMER, 2011).

#### **II.4.5. GUIDELINES DESCRIBED AS USED IN THE ELABORATION OF META-ANALYSES**

In 11 (18%) meta-analyses, the authors said they used established recommended statements to elaborate meta-analyses: seven (64%) according to QUOROM guidelines; two

(18%) using the Cochrane Handbook for Systematic reviews of Interventions guidelines; and PRISMA, MOOSE, and Agency for Healthcare Research and Quality guidelines were used to report one meta-analysis each (Table II.5) (HIGGINS and GREEN, 2011; STROUP *et al.*, 2000; MOHER *et al.*, 1999; MOHER *et al.*, 2009; MATCHAR *et al.*, 2007). Of the 11 meta-analyses, one was reported according to both QUOROM and Cochrane Handbook guidelines.

## **II.5. DISCUSSION**

This study provides evidence on the use of meta-analysis to evaluate the safety of pharmacological interventions published in eight medical journals from 2005 to 2010, selected according to their impact factor on the area of general/internal medicine.

We identified 438 meta-analyses published during the studied period, of which, 60 (14%) assessed drug safety as a primary outcome. The majority was designed to assess drug efficacy and to evaluate non-pharmacological interventions. This result supports our previous concerns that only a limited number of published meta-analyses are currently devoted to monitor safety profile of pharmacological interventions. We also found that several meta-analyses evaluated the same clinical question during the studied period (e.g., risk of cardiovascular events associated with rosiglitazone therapy). This was expected because, during the studied period, some pharmacological interventions were under evaluation because of doubts about their safety profile.

The 60 meta-analyses assessing AEs included experimental studies, observational studies, and both simultaneously. Experimental studies were the predominant source of information in this sample. Experimental studies are accepted to be the gold standard to evaluate drug efficacy, mainly because randomized allocation protects against bias and confounding effects that can threaten the validity of the study. Experimental designs to evaluate drug safety are difficult to carry out, often because of ethical reasons. However, experimental designs that evaluate drug efficacy use rigorous criteria for patient selection and use efficacy end points to estimate sample size and follow-up time. Thus, data on frequent and acute AEs may be observed in these studies, but unknown, rare, and/or long-term latency AEs are difficult to be identified.

Most evidence on harms is more likely to be obtained from pharmacovigilance activities, particularly by using observational studies. Although these studies are more prone to bias and confounding, they offer the advantage of a naturalistic observation, more likely to include a broad representation of the population at risk. However, as it can be found in the present study, meta-analyses including observational studies aiming at drug safety monitoring are relatively few, although there are a vast number of observational studies published, some with remarkable contributions on the study of drug safety (LACROIX *et al.*, 2003; TROMP *et al.*, 2001; VAN STAA, LEUFKENS and COOPER, 2001; SCOLNIK *et al.*, 1994).

The assessment of the methodological quality was reported for the majority of the studies included in the identified meta-analyses. However, for the purpose of quality

123

assessments, different instruments have been developed and applied, giving place for heterogeneity in such evaluations. The use of different instruments can lead to different considerations in terms of weight assigned to key domains. In our study, different scores from quality assessments were not weighted on the overall results in several meta-analyses, therefore not reflecting the impact of poor quality studies on the presented findings. Although it is widely recommended that epidemiologic studies undergo some type of quality review, the method of assessing and incorporating the quality scores is a matter of ongoing debate (JÜNI et al., 1999). Assessing the influence of specific relevant methodological aspects on effects sizes has been a preferred approach recently (JÜNI et al., 1999).

Few meta-analyses included unpublished studies and assessed publication bias. This has been documented as an essential effort in meta-analyses studies because it can influence the accuracy of data and lead to misleading results. The potential consequences of publication bias have been debated for some time (STERNE, EGGER and SMITH, 2001; BAX and MOONS, 2010).

The choice of the selected journals probably shaped what we found because numerous other journals devoted to specific clinical areas or covering the disciplines of pharmacoepidemiology and pharmacovigilance have published relevant meta-analyses, some of those including different studies designs as data sources (HENNESSY *et al.*, 2001; GAGNE, GRIESDALE and SCHNEEWEISS, 2009; LOKE, JEEVANANTHAM and SINGH, 2009; TOH and HERNÁNDEZ-DÍAZ, 2007; CHEN and ASHCROFT, 2006). These journals were selected because they are the most widely read and quoted and, thus, are the most likely to influence clinical practice. Safety is a matter of concern in the use of medicines. To identify if the selected journals highlight safety in the same extent that efficacy is expected to be highlighted was a selected objective of this study. Although this fact may be considered a limitation, its intention was to explore the possibility of imbalance in equal terms of safety and efficacy, therefore modulating clinicians' judgments toward efficacy. The present study only included published meta-analyses. Therefore, eventually existing non-published relevant meta-analyses are not represented.

Despite that we had found meta-analyses devoted to evaluate the safety of pharmacological interventions, they included mostly experimental studies. In 60 metaanalyses, 6 (10%) included observational studies. The usefulness of the observational studies is the detection of rare and long-term latency AEs and the study of minority populations. The evaluation of rare AEs is recognized to be challenging (BRADBURN *et al.*, 2007). The

124

inclusion of different study designs in meta-analyses should be properly planned, depending on the type of outcome, which is being evaluated.

The Safety Planning, Evaluation and Reporting Team formed in 2006 recommend that sponsors develop a program safety analysis plan beginning with first clinical studies, as a tool to proactively plan for meta-analyses at regular intervals during marketed use of a product (CROWE *et al.*, 2009). The ICH E9 guideline also states that meta-analyses should be prospectively planned with the RCTs program in the development of a new treatment (INTERNATIONAL CONFERENCE ON HARMONISATION OF TECHNICAL REQUIREMENTS FOR REGISTRATION OF PHARMACEUTICALS FOR HUMAN USE, 1998).

Meta-analysis is recognized as a valuable method to address safety questions, either defined prospectively or those that are retrospectively addressed. However, the combination of information across all studies is facilitated by the use of consistent approaches in the definitions, data collection, processing, and analysis during drug development and postmarketing (IOANNIDIS *et al.*, 2004; BEHRMAN *et al.*, 2011). The role of meta-analysis in pharmacovigilance is a matter of ongoing debate, and efforts are being made to develop guidelines on the use of meta-analysis in drug safety assessments (DRUG INFORMATION ASSOCIATION, 2011; THE COCHRANE COLLABORATION, 2014).

# **CHAPTER III – APIXABAN AND RIVAROXABAN**

## SAFETY AFTER HIP AND KNEE ARTHROPLASTY: A

**META-ANALYSIS** 

## III. APIXABAN AND RIVAROXABAN SAFETY AFTER HIP AND KNEE ARTHROPLASTY: A META-ANALYSIS

### III.I. ABSTRACT

Direct experimental safety comparisons of Xa coagulation factor direct inhibitors, apixaban and rivaroxaban, on their approved therapeutic indications have not been identified. Due to recently raised safety concerns, a meta-analysis was carried out pooling data from studies identified on a MEDLINE and Cochrane Library search in order to better evaluate the safety profile of both drugs. Abstracts from scientific meetings were also searched from 2003 to 2011. Primary and secondary outcome measures were major bleeding and total bleeding, respectively. Relative risks were estimated using random effects models and statistical heterogeneity was estimated with l<sup>2</sup> statistics. Of the 160 screened publications, 12 RCTs were included in which enoxaparin was the active control. For knee arthroplasty, apixaban was associated with significantly fewer major bleeding events (6496 patients, RR 0.56, 95% CI 0.32-0.96) and fewer total bleeding events (6496 patients, RR 0.81, 95% CI 0.67-0.97). There were no significant differences in the incidence of major bleeding events (5699 patients, RR 1.40, 95% CI 0.56-3.52) or in the incidence of total bleeding events for rivaroxaban (5699 patients, RR 1.09, 95% CI 0.91-1.30). No differences were found when thromboprophylaxis after hip replacement was the case. Apixaban seems to be associated with a lower risk of the incidence of hemorrhagic events after total knee arthroplasty. For hip arthroplasty, no differences were found between the studied drugs.

## **III.2. INTRODUCTION**

Patients submitted to major orthopedic surgery, such as elective total knee or hip arthroplasty, represent a group at high risk of venous thromboembolism (VTE) (WARWICK, 2004). Almost half of the patients who underwent arthroplasty are affected by asymptomatic deep venous thrombosis (DVT), although most of these thrombi resolve without long-term complications (GEERTS et al., 2008; HILL and TREASURE, 2010; RASHID et al., 2010). For some patients, propagation of the existing thrombus can cause symptoms as a result of venous occlusion (GINSBERG et al., 2000). Symptomatic VTE is common after discharge from hospital (DOUKETIS et al., 2002; BJORNARA, GUDMUNDSEN and DAHL, 2006). The most frequent cause for readmission to the hospital following total knee arthroplasty is VTE (SEAGROATT et al., 1991).

The provision of thromboprophylaxis during hospitalization has been established as standard of care for the last 2 decades (ANONYMOUS, 1986). With anticoagulant therapy, incidence of fatal pulmonary embolism (PE) decreased to 0.2%, although symptomatic VTE continues to be reported in 1.3% to 10% of patients within 3 months after surgery (GEERTS et al., 2008; SHARROCK et al., 2008). Low molecular weight heparins (LMWHs), fondaparinux, and vitamin K antagonists have been used as pharmacological agents for VTE prophylaxis. Although these therapies have shown to be effective, they are associated with some practical limitations (HIRSH et al., 2008). Low molecular weight heparin and fondaparinux have the inconvenience of subcutaneous administration, which also can increase the risk of injection site hematomas (LASSEN et al., 2010a; JANG and HURSTING, 2005). Furthermore, subcutaneous administration of anticoagulants is difficult to provide after hospital discharge. Vitamin K antagonists are being abandoned in Europe due to concerns about their delayed onset of action, unpredictable pharmacokinetic and pharmacodynamic effects, and need for frequent monitoring (LEVY, KEY and AZRAN, 2010; ANSELL et al., 2008). Mechanical VTE prophylaxis is known to be cumbersome, and its efficacy is found to be lower when compared with anticoagulant therapy, especially after hip arthroplasty (GEERTS et al., 2008).

The specific limitations of the currently available anticoagulant agents led to the development of new therapies for preventing VTE (WEITZ, 2010; BECATTINI, LIGNANI and AGNELLI, 2010; GROSS and WEITZ, 2008). The direct thrombin inhibitor, dabigatran (Pradaxa, Boehringer Ingelheim, Ingelheim am Rheim, Germany), and the oral direct inhibitors of coagulation factor Xa, rivaroxaban (Xarelto, Bayer, Berlin, Germany) and apixaban (Eliquis, Bristol-Myers Squibb/Pfizer EEIG, Uxbridge, UK), were recently approved by the EMA for

thromboprophylaxis after total knee and hip arthroplasty (NATIONAL INSTITUTE FOR HEALTH AND CARE EXCELLENCE, 2008; NATIONAL INSTITUTE FOR HEALTH AND CARE EXCELLENCE, 2009). Both oral coagulation factorXa direct inhibitors were approved based on evidence provided by phase III RCTs using once daily 40 mg enoxaparin (European regimen) or twice daily 30 mg enoxaparin (North American regimen) as the active control (LASSEN *et al.*, 2009; LASSEN *et al.*, 2010b; ERIKSSON *et al.*, 2008; TURPIE *et al.*, 2009). These studies found that oral coagulation factor Xa direct inhibitors are effective in VTE prevention. However, safety concerns have been raised regarding thromboprophylaxis with rivaroxaban (JENSEN *et al.*, 2011; LOTKE, 2008; CAO *et al.*, 2010; GÓMEZ-OUTES *et al.*, 2009). One study has shown an increased risk of wound complications associated with rivaroxaban (JENSEN *et al.*, 2011). Since the prevalence of fatal PE after total knee arthroplasty is 0.1% and the risk of major and clinically relevant bleeding events with thromboprophylaxis is 3.0%, risk and benefits should be balanced before starting anticoagulation therapies (JOHANSON *et al.*, 2009). The safety of Xa coagulation factor direct inhibitors holding a European market authorization, apixaban and rivaroxaban, have never been evaluated by direct comparisons in RCTs.

The aim of this study was to carry out a meta-analysis in order to comparatively evaluate the safety profile of the direct inhibitors of coagulation factor Xa, apixaban and rivaroxaban, as thromboprophylaxis agents after total knee or hip arthroplasty.

# **III.3. METHODS**

We searched EMA Web site for direct inhibitors of coagulation factor Xa which had been already approved (EUROPEAN MEDICINES AGENCY, 2008; EUROPEAN MEDICINES AGENCY, 2011). Data search and safety analysis were performed according to the therapeutic indication approved by EMA.

#### III.3.1. SEARCH STRATEGY

MEDLINE and the Cochrane Library were searched from its inception until June 27, 2011 in order to identify relevant studies comparing direct factor Xa inhibitors with enoxaparin. Search terms related with knee and hip arthroplasty (eg 'knee operation', 'knee surgery', 'knee arthroplasty', 'hip arthroplasty', 'hip replacement', and 'hip surgery') were combined with thromboembolism prophylaxis terms, such as 'thrombosis prophylaxis', 'deep venous thrombosis prophylaxis', and 'PE prophylaxis'. Text words, brand names, and manufacturer's coded designations were used to identify both factor Xa inhibitors. All languages were considered in the search strategy. The bibliographic list of all relevant RCTs was hand searched in order to identify additional eligible studies. Study lists from systematic reviews and meta-analysis identified during the search process were also considered. The databases of the American Society of Haematology (starting on the 2004 issue) and the International Society on Thrombosis and Haemostasis (starting on the 2003 issue) were searched in order to identify relevant studies published as abstracts. FDA and EMA publicly available records were searched in order to identify studies that met our inclusion criteria. Articles that were not available were requested to the authors. The electronic databases search strategy is available in the Supplemental Data III. I.

#### **III.3.2. STUDY SELECTION**

Literature was searched and relevant studies were examined for further assessment. The studies inclusion criteria were (1) RCTs, (2) patients of all ages undergoing total hip or knee arthroplasty, (3) comparison of safety of factor Xa direct inhibitors with enoxaparin for thromboprophylaxis. Only the oral direct inhibitors of factor Xa holding marketing authorizations in the EU were evaluated. Both trials with blinded and unblinded design were included. Studies focusing on pharmacokinetic or pharmacodynamic variables were excluded.

#### III.3.3. QUALITY ASSESSMENT

Quality assessment of studies was based on the recommendations of the Cochrane Handbook of Systematic Review of Interventions on assessing adverse effects (LOKE, PRICE and HERXHEIMER, 2011). The value of trial data on adverse effects relies on 2 major characteristics: the rigor of monitoring for the adverse effects during the study and the completeness of reporting. Allocation concealment and the withdrawal rates were also evaluated.

#### III.3.4. DATA EXTRACTION

Two reviewers independently extracted data from the included studies. Any disagreements were resolved by consensus or arbitration by a third reviewer. We contacted the authors of studies for missing data when necessary. Data on study characteristics (methodology, included population, study design, and drugs evaluated) and outcomes (bleeding and AEs) during treatment were extracted.

## III.3.5. OUTCOME ASSESSED

The primary outcome of this meta-analysis was the incidence of major bleeding beginning after the first dose of the study drug and up to 2 days after the last dose of the study drug (on-treatment period). Major bleeding was defined as bleeding that was fatal, involved a critical organ (eg, retroperitoneal, intracranial, intraocular, and intraspinal), required reoperation or that was clinically overt, extra-surgical site bleeding associated with a fall in hemoglobin level of at least 2 g/dL, calculated from the day I postoperative baseline value, or requiring infusion of 2 or more units of whole blood or packed cells. Other safety outcomes included any on-treatment bleeding, any on-treatment clinically relevant nonmajor bleeding, drug-related AEs, drug-related serious AEs, and wound complications. Wound complications outcome is the composite of major and/or nonmajor wound bleedings.

Clinically relevant nonmajor bleeding was defined according to the RCTs that evaluated apixaban and rivaroxaban (LASSEN *et al.*, 2009).

# **III.3.6. STATISTICAL ANALYSIS**

Review Manager (RevMan) version 5.1.2 (Cochrane Collaboration, Oxford, UK) was used to calculate RR and 95% Cls for all the primary and secondary outcomes throughout the meta-analysis. All reported P values are 2-sided with significance set at <.05. Statistical heterogeneity was assessed by calculating a chi-square test and the  $l^2$  measure of inconsistency (HIGGINS *et al.*, 2003). Statistical heterogeneity was considered low when 0%<  $l^2 < 25\%$ , moderate when 25%  $< l^2 < 50\%$ , and high when  $l^2 > 50\%$ . We planned to pool data across studies using the DerSimonian and Laird random effects model (DERSIMONIAN and LAIRD, 1986). The publication bias was assessed by examining the funnel plot (BORENSTEIN *et al.*, 2009). We performed a sensitivity analysis to explore the influence on effect size of blinding of outcome assessment and the methodological quality of included trials. For each Xa coagulation factor direct inhibitor, the results of total hip or knee arthroplasty subgroups were compared with the overall meta-analysis. For the sensitivity analysis, RCTs using twice daily enoxaparin 30 mg (North American regimen) as active control were excluded.

# **III.4. RESULTS**

#### **III.4.1. STUDY SELECTION**

Figure III.1 presents the flow of the search strategy criteria. The electronic databases searches returned 165 potentially relevant articles. After review of the titles and abstracts, 142 citations were refused; 16 articles were duplicates; 23 articles were selected for further evaluation. After application of inclusion criteria, 12 studies were eligible for inclusion (LASSEN *et al.*, 2009; LASSEN *et al.*, 2010b; ERIKSSON *et al.*, 2008; TURPIE *et al.*, 2009; LASSEN *et al.*, 2007; TURPIE *et al.*, 2005; ERIKSSON *et al.*, 2006a; ERIKSSON *et al.*, 2006b ERIKSSON *et al.*, 2007; KAKKAR *et al.*, 2008; LASSEN *et al.*, 2008). The review of reference lists scientific society's databases did not find any other relevant studies. No further studies were identified in the FDA and EMA publicly available records.

#### **III.4.2. CHARACTERISTICS OF THE INCLUDED STUDIES**

The main characteristics of the studies are presented in Table III.1. Study design, duration of treatment, demographic characteristics of patients, drugs under evaluation, and number of participants are described. A total of 12 RCTs were found, of which 8 evaluated the efficacy and safety of rivaroxaban versus enoxaparin and 4 evaluated the efficacy and safety of apixaban versus enoxaparin. These RCTs included 28 483 patients, in which 15 586 were randomized to receive rivaroxaban or enoxaparin, and 12 897 were randomized to receive rivaroxaban or enoxaparin, and 12 897 were randomized to receive apixaban or enoxaparin. All the RCTs were performed in adult patients undergoing total knee or hip arthroplasty. Five RCTs evaluated rivaroxaban for thromboprophylaxis in patients undergoing total hip replacement and 3 RCTs evaluated rivaroxaban for thromboprophylaxis agent after total knee arthroplasty in 3 RCTs and 1 RCT evaluated apixaban as thromboprophylaxis agent in patients undergoing total hip replacement.

Rivaroxaban treatment schedules for thromboprophylaxis were comparable among the included RCTs. The patients of the rivaroxaban group received the first dose 6 to 8 hours after skin wound closure. To avoid clinical heterogeneity, for the dose-ranging studies, only the patients that received a total daily dose of 10 mg were included in the analysis. In our study, all the patients received 10 mg/d of rivaroxaban (single dose or 5 mg twice day).

In the 4 apixaban RCT, the apixaban treatment group received the first dose 12 to 24 hours after wound closure. In the apixaban dose-ranging study, only the patients that received 2.5 mg twice daily were included in the analysis. All the patients included in our study treated with apixaban received 2.5 mg twice a day.

The included treatment arms of apixaban and rivaroxaban correspond to the approved total daily dosage for thromboprophylaxis after total hip or knee arthroplasty, which is 5 mg for apixaban, given 2.5 mg twice daily, and 10 mg for rivaroxaban, given once daily or 5 mg twice daily.

Clinical trials included in the meta-analysis used either the enoxaparin dose and regimen approved for use in Europe (40 mg once daily, first dose received 12 hours or the evening before the surgery and medication resumed 6-8 hours after wound closure) or the regimen approved for use in North America (30 mg twice daily, first dose received on the morning after surgery or 12 or 24 hours after wound closure). The enoxaparin European regimen was administrated in 6 RCTs that evaluated rivaroxaban and in 2 RCTs that evaluated apixaban. The enoxaparin (North American regimen) was administrated in 2 RCTs that evaluated rivaroxaban and in 2 RCTs that evaluated rivaroxaban and in 2 RCTs that evaluated rivaroxaban and in 2 RCTs that evaluated apixaban.

#### **III.4.3. QUALITY ASSESSMENT OF THE INCLUDED STUDIES**

The quality assessment of the included trials is presented in Table III.2. All but I RCT were double blind. Allocation concealment was adequate in 9 trials. In 3 trials, allocation concealment was unclear. Information on withdrawal rates was available for all trials and ranged from 9.5% to 44.1%. The monitoring of bleeding events was performed in all trials. Besides bleeding events, few adverse effects were specifically monitored. All trials used an independent adjudication committee masked to allocation to assess the outcomes.

## **III.4.4. PUBLICATION BIAS**

We examined the funnel plot (standard error [SE] of log RR plotted against RR) and did not find evidence of publication bias.

#### **III.4.5. SAFETY EVALUATION RESULTS**

Results of the meta-analysis comparing apixaban and rivaroxaban with enoxaparin are shown in Table III.3 and Table III.4.

According to the results, apixaban presented a more favorable safety profile compared with enoxaparin in the following outcomes: major bleeding events, all bleeding events, and clinically relevant nonmajor bleeding events for thromboprophylaxis after total knee arthroplasty. No significant differences were found when thromboprophylaxis after total hip arthroplasty was the case. For rivaroxaban, no statistically significant differences in safety profile were found when compared with enoxaparin.

#### **III.4.6. S**ENSITIVITY ANALYSIS

The sensitivity analysis limited to double-blind RCTs did not change the results. After removing a phase II, dose-ranging RCT, there were no significant differences for the incidence of clinically relevant nonmajor bleeding events between apixaban and enoxaparin thromboprophylaxis after total knee arthroplasty (6193 patients, RR: 0.75, 95% CI: 0.56-I.00, P = 0.05). For all other outcomes in knee or hip arthroplasty thromboprophylaxis, the removing of any other phase II, dose-ranging, study did not change the results.

For the sensitivity analysis, studies that compared direct inhibitor of coagulation factor Xa with twice daily enoxaparin 30 mg were excluded (Supplmental Data III.2). The removal of RCTs using enoxaparin on the North American regimen as active control did not significantly affect any outcome with rivaroxaban after total hip arthroplasty. One RCT compared rivaroxaban and enoxaparin on European regimen for thromboprophylaxis after total knee arthroplasty (LASSEN *et al.*, 2008). The results of that RCT were similar to those obtained in this meta-analysis, for all outcomes. One RCT compared apixaban with enoxaparin European regimen for thromboprophylaxis after total knee arthroplasty (LASSEN *et al.*, 2008). The results of the compared apixaban with enoxaparin European regimen for thromboprophylaxis after total knee arthroplasty (LASSEN *et al.*, 2008). The results of the compared apixaban with enoxaparin European regimen for thromboprophylaxis after total knee arthroplasty (LASSEN *et al.*, 2008). The results of the compared apixaban with enoxaparin European regimen for thromboprophylaxis after total knee arthroplasty (LASSEN *et al.*, 2010). The results of this RCT were different from those obtained in this meta-

analysis. According to the results of that RCT, there were no significant differences in the incidence of bleeding outcomes when apixaban was compared with once daily enoxaparin 40 mg (major bleeding events: 3009 patients, RR: 0.65, 95% CI: 0.28-1.49, P = 0.30; all bleeding events: 3009 patients, RR: 0.83, 95% CI: 0.65-1.06, P = 0.14; clinically relevant nonmajor bleeding events: 3009 patients, RR: 0.76, 95% CI: 0.52-1.12, P = 0.17). After removing the RCTs that used enoxaparin on North American regimen as active control, no statistically significant differences were observed for wound bleeding rates, drug-related AE rates, and drug-related serious AE rates for both apixaban and rivaroxaban.

| Study                                              | Design           | Allocation concealment | Adverse event monitoring                                                                                                                                                                                                                                                                                                                                                   | Adjudication of<br>adverse events                                                                                                                                                                                                                                 | Withdrawa<br>rate, % |

# **III.5. DISCUSSION**

Clinical guidelines recommend pharmacological prophylaxis for patients undergoing total knee and hip arthroplasty for at least 10 days after the surgery (GEERTS *et al.*, 2008; HILL *et al.*, 2010; JOHANSON *et al.*, 2009). New oral anticoagulants, such as apixaban and rivaroxaban, may provide a more suitable antithrombotic therapy and increase patient compliance, when compared with available alternatives (LMWH and vitamin K antagonists).

Several RCTs compared rivaroxaban versus enoxaparin for thromboprophylaxis after total knee or hip arthroplasty, reporting higher efficacy of rivaroxaban when compared with both European and North American enoxaparin regimens (ERIKSSON *et al.*, 2008; TURPIE *et al.*, 2009; KAKKAR *et al.*, 2008; LASSEN *et al.*, 2008). A previous meta-analysis confirmed that rivaroxaban was superior to enoxaparin as a thromboprophylaxis agent after total hip and knee surgery (CAO *et al.*, 2010). However, a higher number of bleeding events associated with rivaroxaban was identified. As a consequence, the authors do not recommend the use of rivaroxaban in patients susceptible to hemorrhage.

Apixaban was proven to be at least as effective as enoxaparin for thromboprophylaxis after total knee or hip arthroplasty (LASSEN et al., 2010a; LASSEN et al., 2009; LASSEN et al., 2010b). Although in ADVANCE I study apixaban was not shown to be superior to enoxaparin (North American regimen) after knee arthroplasty, it was associated with a lower bleeding risk (LASSEN et al., 2009). When compared with enoxaparin European regimen, apixaban was superior in preventing thromboembolism after knee and hip arthroplasty without increased bleeding risk (LASSEN et al., 2010a; LASSEN et al., 2010b). Another published meta-analysis points out apixaban as effective as enoxaparin for thromboprophylaxis after total knee arthroplasty (HUANG et al., 2011). In this study, apixaban is associated with significantly fewer major bleeding events. These findings raised the need to comparatively evaluate the safety profiles of apixaban and rivaroxaban, once both the drugs were proven to be efficacious in preventing VTE events.

Our meta-analysis included enoxaparin RCTs, in the absence of studies comparing directly both drugs. The results suggest that thromboprophylaxis with apixaban after total knee arthroplasty is associated with a lower risk of major, clinically relevant nonmajor, and total bleeding events, when compared with rivaroxaban. No differences were observed when apixaban and rivaroxaban were compared for thromboprophylaxis after total hip arthroplasty.

In order to avoid clinical heterogeneity of the studies, 2 subgroup meta-analyses were carried out according to the approved therapeutic indications (hip and knee surgery). A sensitivity analysis was also performed aiming at preventing erroneous interpretations of the results. The removing of phase II, dose-ranging, RCTs from the meta-analysis did not significantly altered the results. Eight RCTs (2 with apixaban and 6 with rivaroxaban) used enoxaparin according to the European regimen (40 mg, once daily) and 4 RCTs (2 with apixaban and 2 with rivaroxaban) used enoxaparin according to the European regimen (40 mg, once daily) and 4 RCTs (2 with apixaban and 2 with rivaroxaban) used enoxaparin according to the North American regimen (30 mg, twice daily). The indirect comparison of apixaban with rivaroxaban based on the enoxaparin European regimen significantly altered the results. These findings could suggest that twice daily enoxaparin 30 mg is associated with a higher risk of bleeding. Although both the enoxaparin regimens have never been directly compared, this risk was also observed in a previous meta-analysis (HUANG et al., 2011). Nonetheless, indirect comparisons between the 2 inhibitors of coagulation factor Xa based on both enoxaparin regimens (European and North American) consistently present the trend for lower bleeding risk in patients treated with apixaban.

The overall incidence of drug-related adverse reactions of any cause was similar for both drugs. Apixaban was found to be less associated with wound hemorrhages, although this difference did not reach statistical significance. However, when major and nonmajor wound hemorrhages are observed separately, such difference was no longer observed.

Preclinical studies have shown that both rivaroxaban and apixaban are highly selective for factor Xa (BECATTINI, LIGNANI and AGNELLI, 2010). Although it is suggested that rivaroxaban could be associated with an increased factor Xa inhibitory potential (BARRET et al., 2010), this may cause differences in the efficacy and safety profile of both drugs. Therefore, there is a rationale to compare both rivaroxaban and apixaban safety profiles, since differences in the incidence of PE and major bleeding events can change benefit-risk balance that supports therapeutic decisions.

For the phase II dose-ranging studies, both apixaban and rivaroxaban were compared with enoxaparin regimens (LASSEN *et al.*, 2007; TURPIE *et al.*, 2005; ERIKSSON *et al.*, 2006a; ERIKSSON *et al.*, 2006b; ERIKSSON *et al.*, 2007). Based on their phase II programs, rivaroxaban 10 mg once daily and apixaban 2.5 mg twice daily have proven to have similar efficacy and safety to enoxaparin. Therefore, an indirect comparison can be established between rivaroxaban and apixaban safety profile based on their approved daily doses.

The findings of the present study are based on a pooled analysis of 28 483 patients. Safety outcomes considered in this meta-analysis were those defined in the included RCTs.

To our knowledge, this is the first study comparing the safety of the 2 marketed direct inhibitors of coagulation factor Xa. The findings of this meta-analysis may be useful to more accurately establish benefit-risk ratios of both drugs and in the individualization of drug therapy.

The present study has limitations. First, although it includes the results of welldesigned RCTs with a large number of patients, some relevant clinical outcomes such as rates of wound infection and wound healing were not assessed in all the included RCTs (JENSEN et al., 2011). Second, only I RCT evaluated the safety of apixaban in the thromboprophylaxis after total hip arthroplasty (LASSEN et al., 2010a). Although the RCT included a large number of patients, the availability of more studies would strength the analysis. Third, some heterogeneity between RCTs was found. Such differences could be due to differences in prophylactic treatment duration but also to different enoxaparin regimens (North American and European) used as active control. However, heterogeneity should always be taken into account since each RCT included different populations. Fourth, the number of eligible studies to perform a sensitivity analysis is few. Although an indirect comparison between apixaban and rivaroxaban had been done based on the enoxaparin European regimen, the sample of both included trials could not be powered enough to detect significant differences.

Bleeding is a major concern in patients submitted to thromboprophylaxis after hip or knee arthroplasty after hospital discharge (GEERTS *et al.*, 2008; HILL *et al.*, 2010; JOHANSON *et al.*, 2009). New direct inhibitors of the coagulation factor Xa have proved to be effective in reducing the risk of TVE in a single, unmonitored dose, given orally, which can lead to a more effective anticoagulant therapy. The results of this study suggest that apixaban may be a safer alternative than rivaroxaban for thromboprophylaxis, when total knee arthroplasty is the case. However, more studies are needed, in particular with direct comparisons, in order to better establish the risk profile of these 2 therapeutic agents.

# **CHAPTER IV – A META-ANALYSIS OF SERIOUS**

# ADVERSE EVENTS REPORTED WITH EXENATIDE

# AND LIRAGLUTIDE: ACUTE PANCREATITIS AND

CANCER

# IV. A META-ANALYSIS OF SERIOUS ADVERSE EVENTS REPORTED WITH EXENATIDE AND LIRAGLUTIDE: ACUTE PANCREATITIS AND CANCER

## IV.I. ABSTRACT

The association between Glucagon-like peptide-1 (GLP-1) agonists, acute pancreatitis (AP), any cancer and thyroid cancer is discussed. This meta-analysis was aimed at evaluating the risk of those serious AEs associated with GLP-1 agonists in patients with type 2 diabetes. MEDLINE, EMBASE, Cochrane Library and clinicaltrials.gov were searched in order to identify longitudinal studies evaluating exenatide or liraglutide use and reporting data on AP or cancer. ORs were pooled using a random-effects model.  $I^2$  statistics assessed heterogeneity. Twenty-five studies were included. Neither exenatide (OR 0.84 [95% CI 0.58–1.22],  $I^2 = 30\%$ ) nor liraglutide (OR 0.97 [95% CI 0.21–4.39],  $I^2 = 0\%$ ) were associated with an in-creased risk of AP, independent of baseline comparator. The pooled OR for cancer associated with exenatide was 0.86 (95% CI 0.29, 2.60,  $I^2 = 0\%$ ) and for liraglutide was 1.35 (95% CI 0.70, 2.59,  $I^2 = 0\%$ ). Liraglutide was not associated with an increased risk of AP or cancer associated with GLP-1 agonists. These rare and long-term AEs deserve properly monitoring in future studies evaluating GLP-1 agonists.

# **IV.2. INTRODUCTION**

Pharmacological treatment of type 2 diabetes mellitus usually requires the sequential addition of antihyperglycemic agents (NATHAN *et al.*, 2009). Both the American Diabetes Association (ADA) and the European Association for the Study of Diabetes (EASD) consensus algorithm for the treatment of type 2 diabetes mellitus recommends the initiation of metformin and a lifestyle modification program at the time of diagnosis (NATHAN *et al.*, 2009). Sulphonylureas, thiazolidinediones and insulin can be subsequently added to the therapy (NATHAN *et al.*, 2009).

Glucagon-like peptide-1 agonists are a new class of blood-glucose lowering drugs indicated for the treatment of type 2 diabetes mellitus (DRUCKER et al., 2008; MADSBAD et al., 2004). The first in class, exenatide twice-daily (BID) (Byetta<sup>™</sup>, Amylin Pharmaceuticals, San Diego, CA, USA/Eli Lilly and Company, Indianapolis, IN, USA), was approved by the FDA and by the EMA in 2005 and 2006, respectively (Us FOOD AND DRUG ADMINISTRATION, 2005; EUROPEAN MEDICINES AGENCY, 2006). Lately, a once-weekly (QW) presentation of exenatide (Bydureon<sup>™</sup>) received a market authorization in Europe (2011) and in the United States (2012) (US FOOD AND DRUG ADMINISTRATION, 2012; EUROPEAN MEDICINES AGENCY, 2011). Liraglutide (Victoza<sup>™</sup>, Novo Nordisk A/S, Bagsværd, Denmark) was authorized by EMA and FDA in 2009 and 2010, respectively (US FOOD AND DRUG ADMINISTRATION, 2010; EUROPEAN MEDICINES AGENCY, 2009). During the clinical development programmes, the GLP-1 agonists have demonstrated the potential to address fasting and postprandial glucose control with weight loss and low risk of hypoglycaemia (EUROPEAN MEDICINES AGENCY, 2006; EUROPEAN MEDICINES AGENCY, 2009; EUROPEAN MEDICINES AGENCY, 2011). However, this new class of antihyperglycaemic drugs has demanded some attention since potentially, although rare, serious AEs have been associated with their use (DRUCKER et al., 2010).

Post-marketing spontaneous reports of acute pancreatitis among patients treated with exenatide BID have been submitted to FDA's Adverse Event Reporting System (FDA-AERS) since 2005 (US FOOD AND DRUG ADMINISTRATION, 2007). Signal generation analyses of this database identified an increased risk for acute pancreatitis associated with exenatide (ELASHOFF et al., 2011; RASCHI et al., 2013). However, further observational longitudinal studies did not confirm such findings (DORE, SEEGER and CHAN, 2009; GARG, CHEN, and PENDERGRASS, 2010; DORE et al., 2011). The post-marketing case reports led to an update of the exenatide' product labeling, on request of FDA (US FOOD AND DRUG ADMINISTRATION,

2009). Acute pancreatitis was also reported in RCTs with liraglutide (PARKS and ROSENBRAUGH, 2010).

Benign thyroid C-cell adenomas were observed in rodents treated with exenatide BID but no carcinomas were reported (EUROPEAN MEDICINES AGENCY, 2006; DRUCKER *et al.*, 2010). Thyroid tumors occurred in rats administered with exenatide QW in carcinogenicity studies (EUROPEAN MEDICINES AGENCY, 2011). During RCTs, unspecified neoplasms have been reported in patients treated with exenatide BID (EUROPEAN MEDICINES AGENCY, 2006). For liraglutide, C-cell hyperplasia and thyroid cancer were observed in pre-clinical toxicology studies (EUROPEAN MEDICINES AGENCY, 2009; BJERRE KNUDSEN *et al.*, 2010). Several cases of thyroid cancer were also reported during the liraglutide clinical development programme (EUROPEAN MEDICINES AGENCY, 2009; PARKS and ROSENBRAUGH, 2010). When approved by FDA, liraglutide label carries a Black Box warning regarding the risk of thyroid c-cell cancer (US FOOD AND DRUG ADMINISTRATION, 2010).

This study was aimed at evaluating the risk of acute pancreatitis, any cancer or thyroid cancer, associated with GLP-I agonists, exenatide and liraglutide, by carrying out a meta-analysis based on both experimental and observational published studies.

# **IV.3. METHODS**

#### **IV.3.1. LITERATURE SEARCH**

MEDLINE and Cochrane Library were searched from its inception until May 24, 2012 in order to identify relevant studies which evaluated GLP-I agonists holding a market authorization (Us FOOD AND DRUG ADMINISTRATION, 2005; EUROPEAN MEDICINES AGENCY, 2006; US FOOD AND DRUG ADMINISTRATION, 2012; EUROPEAN MEDICINES AGENCY, 2011; US FOOD AND DRUG ADMINISTRATION, 2010; EUROPEAN MEDICINES AGENCY, 2009]. Text words, brand names and manufacturer's coded designations were used to identify the medicines. Only literature published in the English language was considered for inclusion in this analysis. In order to ensure that all studies were identified, a second electronic search in the Medline and EMBASE was performed. Search terms related with pancreatitis and with cancer were combined with the medicines designations priori stated. The search terms were identified by consulting the MedDRA dictionary (MEDICAL DICTIONARY FOR REGULATORY ACTIVITIES, 2011). Bibliographic references list of all relevant studies, meta-analyses and reviews were hand searched in order to identify additional eligible articles. The registration site clinicaltrials.gov was searched in order to identify all studies with available results that evaluated exenatide or liraglutide in type 2 diabetes mellitus. We did not seek to identify safety information of GLP-I agonists beyond published studies. All the studies reporting zero events in the treatment and/or control group were included. The electronic databases search strategy is available in Supplemental Data IV.I.

#### **IV.3.2. STUDY SELECTION AND QUALITY ASSESSMENT**

Literature was searched and relevant studies were selected for further assessment. The studies inclusion criteria were: I - published in English language; 2 - RCTs or longitudinal observational studies (case-control or cohort studies); 3 - patients of all ages with type 2 diabetes mellitus; 4 - comparison of GLP-1 agonists with a placebo or active control (oral hypoglycaemic agents or insulin) and 5 - effect estimates on acute pancreatitis or cancer associated with GLP-1 agonists use. Only studies with duration of at least 12 weeks were included. The quality of the retrieved studies was assessed using the checklist proposed by Downs and Black (DOWNS and BLACK, 1998). Studies' methodological quality was assessed as high, moderate or low when the total score was  $\geq 20$ , from 10 to 19, and < 10, respectively. When more than one reference was found for the same study, methodological quality evaluation was based on the total set of information. Two investigators scored the studies independently. Disagreement was resolved by discussion and consensus with a third investigator.

#### IV.3.3. DATA EXTRACTION AND OUTCOMES ASSESSED

Data on study design, study duration, characteristics of participants, antihyperglycaemic therapy (dosage and treatment duration) and estimated effect measures or specified outcomes was extracted.

The following outcomes were considered: acute pancreatitis, any cancer and thyroid cancer. For any cancer as an outcome, all the events defined as 'Neoplasms benign, malignant and unspecified (including cysts and polyps)' according to the MedDRA dictionary were considered (MEDICAL DICTIONARY FOR REGULATORY ACTIVITIES, 2011). For thyroid cancer, all terms were considered as those defined in the MedDRA dictionary were taking into consideration (MEDICAL DICTIONARY FOR REGULATORY ACTIVITIES, 2011).

#### **IV.3.4. STATISTICAL ANALYSIS**

A meta-analysis was performed by pooling ORs with their 95% confidence intervals Cls, using the DerSimonian and Laird random-effects model and assuming that OR was an unbiased estimate of the RR (DERSIMONIAN and LAIRD, 1986). This model was chosen since the validity of tests of heterogeneity can be limited with a small number of component studies and it is more conservative than a fixed-effect model in the presence of between-studies heterogeneity. When more than one adjusted effect estimate was reported, the most adjusted estimate was used. For studies with more than one intervention-arm, the number of events and the number of exposures were added. The same was applied when studies with multiple controls were the case. Between-studies heterogeneity was assessed by calculating a chi-square test and the l<sup>2</sup> measure of inconsistency (HIGGINS *et al.*, 2003). When no events were reported in one or both groups, a continuity correction of 0.5 was added to each cell.

The publication bias was visually examined by a funnel plot and statistically evaluated by Egger's regression asymmetry test (BORENSTEIN *et al.*, 2009; EGGER *et al.*, 1997).

A sensitivity analysis was conducted to explore the influence of the following variables on the summary estimates: studies' design, studies' methodological quality scores, the nature of the comparators (placebo or active control) and different GLP-I agonists dose regimens (weekly or daily). All reported P values are 2-sided with significance being set as less than 0.05.

Review Manager (RevMan) version 5.1.6 (Cochrane Collaboration, Oxford, UK) and Comprehensive Meta-analysis Version 2 (Biostat, Englewood, NJ, USA) were used for all statistical analysis.

## **IV.4. RESULTS**

The flowchart of the search strategy criteria is presented in Figure IV.1. The electronic databases searches returned 4373 possible eligible references. After excluding for duplicates and screening the titles and abstracts, 179 bibliographic references were selected and full reports were obtained and evaluated in detail against inclusion criteria. A final sample of 40 references was eligible for inclusion, corresponding to 25 studies. No further studies meeting the inclusion criteria were identified throughout the studies back references lists'. Of the included studies in the analysis, 3 were retrospective cohorts and the remaining were RCTs. Two studies directly compared exenatide and liraglutide (Supplemental IV.2 References 13,14,21).

The main characteristics of the studies and their methodological quality are presented in Table IV.1. More than one article can be referred to one study. For some studies, the information from the public database clinicaltrials.gov complemented that reported in published papers (e.g., length of follow-up). The methodological quality was considered "high" for 15 studies and "moderate" for the other 10 studies.

Data from this study was not included in the GLP-1 receptor agonists drug class outcomes estimates; s.c. – subcutaneously; p.o. – orally; Lira – Liraglutide; Sita – Sitagliptin; T2 DM – Type 2 diabetes mellitus; Glime – Glimepiride; SU – Suphonylurea; Gliben – Glibenclamide; ROSI – Rosiglitazone; Exe – Exenatide; METF – Metformin; GLIMEP - Glimepiride; PIA – Premixed Insulin Aspartat; UTD – unable to determin; IG – Insulin glargine; Sita – Sitagliptin; PIO – Pioglitazone; BIAsp – Biphasic insulin aspartat; BIG; - Biguanide; THIAZ; thiazolidinedione; Ins – Insuline; double-blinded and then become open-label in the extension phase. • Number of patients included in the safety analysis; ID – Intervention drug; C – Control; n for "Acute Pancreatitis" and "Cancer" represents the number of patients; M.Q. – Methodological quality assessment; NR – Not reported; The studies LEAD-6 and NCT01029886 compared liraglutide with exenatide. a References for the studies displayed in this table are listed in the Supplement 2. <sup>b</sup>Concealment assignment is referring to the most recent studies' publication. Studies could be initially ADs: antidiabetic drugs

#### **IV.4.1. ACUTE PANCREATITIS**

Thirteen studies of exenatide reported acute pancreatitis outcomes (Figure IV.2a). Pooling their estimates yielded an OR of 0.84 (95% CI 0.58–1.22). Similar results were found in the subgroup analysis according to study design for both RCTs (OR 1.70, 95% CI 0.35–8.29) and retrospective cohorts (OR 0.79, 95% CI 0.49–1.27) (Table IV.2). Between-studies heterogeneity accounted for 30% (P = 0.20) of variation in treatment effect, mainly among observational studies ( $I^2 = 70\%$ , P = 0.03) than between RCTs ( $I^2 = 0\%$ , P = 0.76). The results did not significantly change from the initial estimates when stratification according to different controls, exenatide dose regimens or when only high methodological quality studies were considered. Non-significant between-studies heterogeneity was observed (Table IV.2).

Twelve liraglutide RCTs reported acute pancreatitis as an outcome (Figure IV.2a). The estimated OR for liraglutide and acute pancreatitis was 0.97 (95% Cl 0.21 - 4.39). No significant between-studies heterogeneity was observed. The sensitivity analysis according to different controls and the methodological quality of the studies did not significantly change the results (Table IV.2).

No significant risk reduction was observed in acute pancreatitis for both GLP-1 agonists (OR 0.87, 95% CI 0.64 -1.17).

### IV.4.2. ANY CANCER

Ten RCTs studying exenatide reported cancer outcomes (Figure IV.2b). Exenatide was not associated with a significant risk of cancer development (OR 0.86, 95% CI 0.29 - 2.60). The sensitivity analysis according to the different controls, therapeutic regimen and the methodological quality of the studies did not significantly change the results (Table IV.2).

Ten RCTs with liraglutide in type 2 diabetes mellitus reported cancer outcomes (Figure IV.2b). Liraglutide was associated with a statistically non-significant 35% increased risk for any cancer development (OR 1.35, 95% CI 0.70 - 2.59). When liraglutide was compared with different controls, the results did not become statistically significant. However, the stratification of the results becomes statistically significant when only methodological studies of high quality were considered (OR 2.60, 95% CI 1.08 - 6.27) (Table IV.2).

No significant risk reduction was observed in cancer for both GLP-1 agonists (OR 1.24, 95% CI 0.68 - 2.27) and no significant heterogeneity was observed in any of the comparisons (Table IV.2).

### IV.4.3. THYROID CANCER

None of the studies evaluating exenatide reported cases of thyroid cancer. Of the studies evaluating liraglutide, five reported cases of thyroid cancer. Nine patients treated with liraglutide were diagnosed with thyroid cancer comparing to one patient who developed this type of cancer and was treated with glimepiride (Supplemental Data IV.2 References 4-6, 9, 10, 13, 14, 16-18). The OR for thyroid cancer occurrence associated with liraglutide treatment was 1.54 (95% CI 0.40-6.02, P = 0.53,  $I^2 = 0\%$ ).

### **IV.4.4. PUBLICATION BIAS ASSESSMENT**

Egger's asymmetry test was not statistically significant for the primary or and most subgroup analyses but was significant for the analysis among exenatide RCTs (P = 0.01) and for once- weekly exenatide regimen studies (P = 0.01) (Table IV.2). Subjective evaluation of publication bias was based on the visual inspection of funnel plot. Few studies were considered for both the analyses, not allowing firm conclusions about the potential publication bias. Regarding cancer risk assessment, large studies are possibly absent for both exenatide and liraglutide.

Table IV.2 - Pooled ORs and 95% Cls of acute pancreatitis and cancer associated with GLP-I agonists.

Note: \* Egger's regression asymmetry test. For GLP-1 agonists pooled results, both LEAD-6 and NCT01029886 studies weren't included.

### **IV.5. DISCUSSION**

The results of this meta-analysis suggest that neither exenatide nor liraglutide increase the risk for acute pancreatitis, when used in the treatment of type 2 diabetes mellitus. However, no conclusions can be drawn since the analysis is based on small studies, possibly underpowered to detect rare AEs.

Our findings are in line with those reported in longitudinal observational studies which evaluated the risk for acute pancreatitis associated with exenatide (DORE, SEEGER and CHAN, 2009; GARG, CHEN, and PENDERGRASS, 2010; DORE *et al.*, 2011). The rates of acute pancreatitis in those studies were less than 0.5%, indicating that this is a rare AE. Our search did not find post-market observational studies for liraglutide.

Although evidence of association has not been established between GLP-1 agonists and acute pancreatitis, a few potentially confounding factors should be considered. Nausea, abdominal discomfort and vomiting are adverse drug reac-tions known to be associated with GLP-1 agonists use (European Medicines Agency, 2006; European Medicines Agency, 2009; EUROPEAN MEDICINES AGENCY, 2011). Since these events are also symptoms of acute pancreatitis, its recognition and appropriately diagnose may become difficult (BALANI and GRENDELL, 2008). We only included studies with patients diagnosed with type 2 diabetes mellitus. It was recently documented that having type 2 diabetes puts patients in a higher risk of developing acute pancreatitis, independently of the drug therapy (NOEL et al., 2009). This may raise the question of whether the cases of acute pancreatitis are due to GLP-1 agonists therapy, to type 2 diabetes or to risk factors commonly seen in patients with type 2 diabetes - hypertriglyceridaemia, hyperlipidaemia, obesity, or concomitant medicines (ANDERSON and TRUJILLO, 2010). Considering that GLP-1 agonists were initially approved as type 2 diabetes add-on therapy and the recommendations of clinical guide-lines, patients receiving GLP-1 agonists are more likely to be at more advanced stages of the disease, which increases the risk for pancreatitis, the potential for confounding by indication may be increased, particularly when observational studies are the case (NATHAN et al., 2009; GARG, CHEN, and PENDERGRASS, 2010). Based on spontaneous reports of adverse drug reactions, FDA recommended that the prescribing information of exenatide should include a warning about the risk of acute pancreatitis (US FOOD AND DRUG ADMINISTRATION, 2009). Liraglutide' prescribing information also includes a warning about the risk of pancreatitis, without a specific mention to its onset, type or severity (US FOOD AND DRUG ADMINISTRATION, 2011). This meta-analysis did not find any increased risk for acute pancreatitis associated with both

GLP-1 agonists. Labeling change of exenatide regarding acute pancreatitis required by FDA was supported by spontaneous reports. Therefore, if the increased risk exists, the metaanalysis is unable to identify such risk, since spontaneous reporting data is not considered in the meta-analysis methodology. Similarly the FDA required the market authorization holder of liraglutide to conduct post-approval mechanistic animal studies along with a pharmacoepidemiologic study in order to better assess the risk of acute pancreatitis (PARKS and ROSENBRAUGH, 2010).

Several studies were conducted aiming to explain the mechanisms by which acute pancreatitis could be developed. Butler et al. presented a theoretical model on which GLP-1 agonists could amplify the pancreatic ductal replication already increased by type 2 diabetes mellitus or obesity (BUTLER, DRY and ELASHOFF, 2010; BUTLER *et al.*, 2010). This would increase the risk for low grade chronic pancreatitis that predisposes to acute pancreatitis or pancreatic carcinoma. However, the results of preclinical studies were contradictory, remaining unknown if GLP-1 agonists are associated with a specific pharmacological mechanism that may cause pancreatitis (KOEHLER *et al.*, 2009; NACHNANI *et al.*, 2010; VRANG *et al.*, 2012). In order to avoid misclassification bias, and since the results of pre-clinical studies have shown to be contradictory, only cases reported as acute pancreatitis were included in this meta-analysis.

The possible carcinogenic effect of GLP-1 agonists observed during the pre-clinical studies should be properly evaluated. Moreover, the analysis of disproportion of the FDA-AERS database performed by Elashoff and colleagues (2011) demonstrated an increased risk for thyroid cancer associated with exenatide. This meta-analysis did not identify an increased risk for any cancer associated with exenatide. The risk remained unchanged when the analysis was stratified according to the therapeutic regimens or different comparators. Regarding liraglutide exposure, no difference was observed when data from all studies was integrated or when the results were stratified according to the type of comparator. However, sensitivity analysis restricted to five high methodological quality studies showed an increased risk of cancer from all causes in patients treated with liraglutide. Caution should be taken when interpreting this result, since is the only significant association found, suggesting a possible chance of finding. Several instruments have been developed in order to assess the methodological quality of the studies (JÜNI *et al.*, 1999). The scale of Downs and Black was chosen since it is able to assess both experimental and observational studies (DOWNS and BLACK, 1998).

Although the total number of cancer events was found to be low, a divergence between the risk of cancer associated with exenatide and liraglutide was identified (-14% for exenatide and 35% for liraglutide, both non-significant) (Table 12). Such findings deserve further careful attention. Moreover, when only high quality studies were considered, this difference increases. The present evaluation is based only in data from RCTs since observational studies were not identified in our search strategy. Clinical trials are able to identify the most frequent and common AEs that occurred during the intervention administration. However, considering cancer as a long-latency event, the duration of RCTs and the short period between initial liraglutide exposure and malignancies diagnosis do not allow the establishment of a reliable causality between liraglutide exposure and cancer. No cases of C-cell lesions in thyroid have been documented in patients treated with exenatide. An increased proportion of thyroid carcinomas in patients treated with liraglutide have been reported in the included studies when compared with controls. However, the increased risk was non-statistically significant. As Drucker and colleagues (2010) previously stated, the small number of cases and the lack of biological plausibility raise some doubts between the use of GLP-1 agonists, namely liraglutide, and thyroid cancer occurrence. Moreover, the effects of this drug in humans, particularly in the human thyroid gland, are unknown and difficult to be extrapolated from pre-clinical studies, despite the C-cell hyperplasia in rats (PAROLA, 2009). The findings of this meta-analysis enhance the need for long-term welldesigned epidemiological studies devoted to assess the risk for cancer associated with GLP-1 agonists, including thyroid cancer during liraglutide exposure. Additional studies in animals and the establishment of a cancer registry database to monitor the incidence of medullary thyroid cancer associated with liraglutide was required by the FDA (PARKS and ROSENBAUGH, 2010).

This meta-analysis may be subject to several limitations. Of the 22 RCT included, only one included the clinical evaluation of pancreatitis. Despite two RCTs have evaluated the calcitonin levels, none of them were designed to prospectively monitor for malignancies. Pancreatitis and cancer were not defined as an initially outcome measure of RCTs. These events were recorded as serious AEs. The absence of malignancies and/or pancreatitis pre-defined diagnostic criteria can lead to missing events. Moreover, patients enrolled in the RCTs are usually younger and with less comorbidities, being at a lower risk for developing the AEs studied in this meta-analysis when compared with the average patients with type 2 diabetes observed on routine clinical practice. Residual confounding in the included observational studies may extend to the results of this meta-analysis.

Different controls were identified in the RCTs included in this meta-analysis and they might be associated with different risks for acute pancreatitis or cancer, such the case of gliptins or pioglitazone. Because of the heterogeneity of comparators and the relatively small number of acute pancreatitis and cancer events reported in the studies, the stratification of the results at this level is difficult.

Publication bias with regard to acute pancreatitis and cancer is difficult to assess with few studies. In two acute pancreatitis analyses, the results were significant. This may be the case of RCTs unpowered to detect rare events and subsequently creating difficulties in AEs assessments. The European Public Assessment Report (EPAR) of exenatide BID reports that several neoplasms occurred in patients treated with exenatide BID during the clinical development programme, without specifying its type (EUROPEAN MEDICINES AGENCY, 2006). We were unable to find such data in published studies (DEFRONZO *et al.*, 2005; KENDALL *et al.*, 2005; BUSE *et al.*, 2004). This suggests that publication bias may be present in our metaanalysis despites non-significant results observed for this outcome in the Egger's regression asymmetry test. We did not seek to collect data beyond that which is published. However, non-publication of events of such severity turns difficult the correct benefit/risk ratio assessment, and in particular the assessment of the risk for cancer and its subtypes.

Current available published evidence is insufficient to support an increased risk of acute pancreatitis or an increased risk of cancer from all causes associated with GLP-1 agonists. However, there is a growing body of evidence from postmarketing spontaneous reports. Physicians and patients should remain vigilant for episodes of acute pancreatitis or cancer and report any events to the correspondent pharmacovigilance system. Since trials' size, duration and design may not be appropriate to accurately assess the risk of rare or long-term AEs, such acute pancreatitis or cancer, and it is unlikely that randomized trials of GLP-1 agonists designed to detect malignancies will ever exist, clinicians should rely on observational studies in future assessment of the risk of cancer. A rigorous monitoring of these outcomes should be implemented in the future studies since current evidence was not adequately designed to address this issue, precluding any definitive conclusion.

# CHAPTER V – SOURCES OF INFORMATION USED BY

# **REGULATORY AGENCIES ON THE GENERATION OF**

**DRUG SAFETY ALERTS** 

# V. SOURCES OF INFORMATION USED BY REGULATORY AGENCIES ON THE GENERATION OF DRUG SAFETY ALERTS

### V.I. ABSTRACT

The study of the grounds on which data regulatory authorities base their decisions on drug safety evaluations is an important clinical and public health issue. The aim of this study was to review the type and publication status of data sources supporting benefit/risk ratio reevaluations conducted by the major regulatory authorities on safety issues. A website search was carried out to identify all safety alerts published by the FDA, Health Canada, EMA and the Australian Therapeutics Goods Administration (TGA). Safety alerts were included if the causal relation between a suspected drug exposure and the occurrence of an AE was evaluated for the first time between 2010 and 2012. Type of data sources evaluated by these regulatory authorities, publication status of the data sources and status of the drug label section with respect to updating were evaluated. A total of 59 safety alerts were included in this study. Of these, 33 (56%) were supported by postmarketing spontaneous reports, 24 (41%) evaluated RCTs, 16 evaluated cohort studies (27%), 13 were case-control studies (22%) and 11 evaluated case report/case-series (17%). Twenty-three safety alerts (39%) were issued based. on unpublished evidence, corresponding mainly to postmarketing spontaneous reports. The "Warnings and precautions section" was the drug label section most frequently updated (n=40; 68%). Despite the different lengths of time taken by the different regulatory authorities to come to similar decisions on the same issues - an issue which would seem to deserve further harmonization - post-marketing spontaneous reports have supported most of the benefit/risk ratio reevaluations, thereby confirming the value of such method in detecting unknown AEs.

## **V.2. INTRODUCTION**

Assessment of the benefit/risk relation is conducted throughout the entire life cycle of a drug, starting from its clinical development and continuing during the post-licensing phase (US FOOD AND DRUG ADMINISTRATION, 2012). Before a market authorization is granted, drugs are studied for a defined therapeutic indication in RCTs with a limited duration and with strict inclusion/exclusion criteria for a relatively small number of patients (MADRE *et al.*, 2006). These are accepted limitations to RCTs, one of which is that not all harmful effects can be easily anticipated (WYSOWSKI and SWARTZ, 2005). Some AEs can only be detected after marketing authorization, and these may be sufficiently serious to require a change in the established benefit/risk relation profile of a particular drug, leading to its label change or even market removal (MOORE, SINGH and FURBERG, 2012).

Post-marketing spontaneous reporting systems are useful to identify rare and/or serious AEs which could not be anticipated during the pre-approval stage (Wysowski and SWARTZ, 2005; AHMAD, MARKS and GOETSCH, 2006). Spontaneous reporting of AEs covers all drugs during their entire life cycle, both the whole population and special subgroups (EDWARDS *et al.*, 2006). However, regulatory authorities recognize that this surveillance system may have limitations, such as underreporting or lack of data on the number of exposed individuals (US FOOD AND DRUG ADMINISTRATION, 2008).

Additional studies are usually needed to confirm safety signals identified through spontaneous reports (EDWARDS *et al.*, 2006; US FOOD AND DRUG ADMINISTRATION, 2008). Indeed, observational studies may better reflect the nature of AEs occurring in clinical practice since they include populations usually underrepresented in RCTs, such as the elderly, pregnant women or patients with comorbidities (MADRE *et al.*, 2006; ROTHWELL *et al.*, 2005; PAPANIKOLAOU, CHRISTIDI and IOANNIDIS, 2006).

Safety signals represent findings and results from "reported information on a possible causal relationship between an AE and a drug, being the relationship unknown or incompletely documented at that time" (EDWARDS and BIRIELL, 1994). A safety signal can also be generated from other sources than post-marketing spontaneous reports, such as preclinical data, observational longitudinal studies or even from information on other drugs of the same pharmacological class (BULL, 2007). Therefore, postmarketing data collection and risk assessment are critical steps in characterizing a drug's safety profile and lead to better decisions on which regulatory actions should be implemented (BULL, 2007; US FOOD AND DRUG ADMINISTRATION, 2011). As a consequence, the study of the grounds on which supporting data have been reviewed by regulatory authorities on clinical safety evaluations is an important public health issue.

The aim of this study was to review the type and publication status of data sources supporting benefit/risk ratio reevaluations conducted by four major regulatory authorities on safety issues evaluated between January 2010 and December 2012.

### V.3. METHODS

The websites of four health regulatory authorities and reference data sources were reviewed to identify safety alerts. Data were extracted from the following publicly accessible addresses: the FDA "Drug Safety Communications", "Advisories, warnings and recalls" of Health Canada, EMA "News, press release and public statement archive", monthly reports of the "CHMP" Pharmacovigilance Working Party" and "Pharmacovigilance Risk Assessment Committee", and the TGA "All alerts" and "All recalls" (US FOOD AND DRUG ADMINISTRATION , 2014; HEALTH CANADA, 2013; EUROPEAN MEDICINES AGENCY, 2014; EUROPEAN MEDICINES AGENCY, 2013; THERAPEUTIC GOODS ADMINISTRATION, 2014; THERAPEUTIC GOODS ADMINISTRATION, 2014). Safety alerts were included if the causal relation between a suspected drug exposure and the occurrence of an AE was evaluated for the first time between January 2010 and December 2012. Natural and healthcare products, medical devices, contrast agents, drug-drug interactions, drug-food interactions, medication errors, evaluations of lack of efficacy and AEs occurring during off-label use were not considered for inclusion.

Only safety alerts on drugs with market authorization and simultaneously included in one of the 30 most prescribed drug classes worldwide used in the ambulatory setting were considered for inclusion (Supplemental Data V.I). Drug classes were considered as the second level therapeutic subgroup of the ATC classification system (WHO COLLABORATION CENTRE FOR DRUG STATISTICS METHODOLOGY, 2014). Data on sales of drug classes were requested from IMS (Intercontinental Marketing Services) Health. The bibliographic lists of all relevant safety alerts were hand searched in order to identify additional eligible safety alerts. The website search and the safety alerts selection were conducted by one researcher (Carlos Alves). A second researcher scanned the included safety alerts (Ana Filipa Macedo). Discrepancies were resolved by majority (two out of three) decision involving a third investigator (Francisco Batel Marques).

The following information from each safety alert was extracted: (1) date of first publication; (2) regulatory authority issuing the safety alert; (3) suspected drug(s); (4) AE of interest; (5) type of data source supporting the evaluation, namely: (1) study design; (ii) results for the outcome of interest; (iii) publication status; (6) drug label' section(s) updated. "Drug remains under revision" or "benefit/risk ratio unchanged" were considered when any label change was performed.

Regarding the publication status of the data sources, postmarketing spontaneous reports and studies consulted by regulatory authorities which had not been published at the time of the safety alert disclosure were considered to be unpublished data. Updates of the same safety alert were revised in order to retrieve further information on the regulatory authority decision and/or other data sources evaluated. Two safety alerts were considered to be evaluating the same clinical question when they assessed the same AE for the same suspected drug(s). Each safety alert could have been supported by more than one type of data source. More than one section of the drug label could have been updated. Regulatory authorities could have decided to keep the suspected drug(s) under revision despite labeling changes having been carried out.

### V.4. RESULTS

The results of our search of the regulatory authorities' websites are displayed in Figure V.1. A total of 1,204 publications were initially identified, of which 953 were excluded after further review of the titles, subjects and publication dates. This resulted in 251 safety alerts identified as "possibly eligible" for inclusion. After confirming the drug class as one of the 30 most consumed worldwide in ambulatory care, 59 safety alerts were included in the study, of which five were published by TGA, 13 by Health Canada, 16 by FDA and 25 by EMA.

Table V.I describes the characteristics of the eligible safety alerts. Forty-two different clinical questions were evaluated in the 59 safety alerts, of which 28 clinical questions were evaluated by only one regulatory authority and the remaining 14 by at least two regulatory authorities. Thirty-two different drugs or drug classes were evaluated.

### V.4.1. SCIENTIFIC INFORMATION SOURCES EVALUATED IN SAFETY ALERTS

Table V.2 presents the different scientific information sources evaluated by the regulatory authorities. Thirty-three (56 %) safety alerts issued by authorities supported their regulatory decisions on post-marketing spontaneous reports, of which 18 (20%) were based exclusively on this data source. Twenty four (41%) safety alerts evaluated RCTs, eight (14%) of them exclusively. Cohort studies supported 16 (27 %) regulatory decisions, followed by case-control studies (n=13; 22 %) and case report/case-series (n=11; 17 %). Meta-analyses of RCTs, meta-analyses of observational studies, retrospective cohorts and surveys supported regulatory decisions on six (11 %) safety alerts each. Health Canada and EMA did not provide the scientific evidence supporting two evaluations.

The design of studies supporting the review of three safety alerts (5 %) by authorities was not specified.

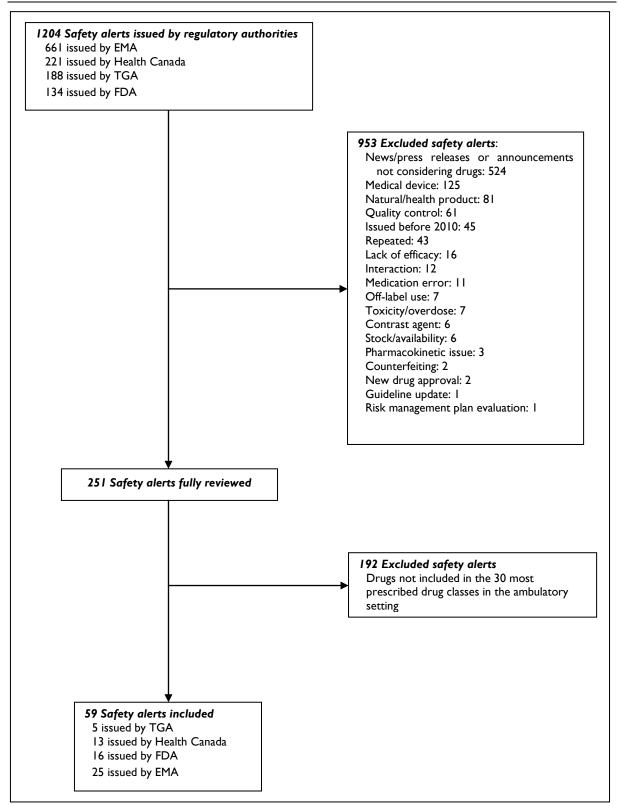

Figure V.I - Flow diagram of identification of safety alerts for inclusion.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                           |
