                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | under                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | -     survey (prospective)<sup>137-140</sup> 2 RCTs<sup>141,142</sup> Sources of information used by regulatory agencies on the generation of drug safety alerts

short communication; The references list is presented at Supplemental Data V.2.

#### V.4.2. PUBLICATION STATUS OF DATA SOURCES

The publication status of data sources evaluated by regulatory authorities is presented in Table V.2. Twenty-two (37 %) safety alerts were supported by published and unpublished evidence. Most of the unpublished evidence evaluated by the authorities consisted of postmarketing spontaneous reports (17/22). At the date of their release, the regulatory decisions on four safety alerts were supported by studies (cohort, case-control and meta-analysis of RCTs) subsequently published as full papers.

Twenty-one (36 %) safety alerts were issued based solely on unpublished scientific evidence. The majority of these alerts (16/21) were based on postmarketing spontaneous reports, followed by the results of RCTs (7/21). The regulatory decisions on citalopram and escitalopram and the risk for arrhythmia (QT interval prolongation) were based on postmarketing spontaneous reports and unpublished data from RCTs. Clinical trials supporting regulatory decisions on tinzaparin had not been published when the respective safety alerts were issued.

Fourteen safety alerts were supported exclusively on scientific evidence already published. Observational studies were revised by regulatory authorities in the majority of these alerts (8/14). A safety alert on Atomoxetine was issued by three regulatory authorities which relayed their decision on RCTs sponsored by the drug' market owner but did not provide references.

#### V.4.3. REGULATORY ACTIONS

Table V.3 describes the different safety regulatory actions and the frequency by which they were applied. The most commonly updated drug label section was the Warnings/Precautions section (n=40; 68 %), followed by the update of the Contraindications section (n=17; 29 %). Updates of the Dosage section due to new recommendations were made in eight evaluations (14 %). New boxed warnings were issued on two occasions (3%). The marketing authorization of an association of drugs was preventively suspended. In eight safety alerts (14 %) the authorities announced that the benefit/risk ratio of the drug remained positive. The safety profile of nine (14 %) drugs/drug classes remains under revision.

The Australian TGA took a regulatory decision upon the evaluation conducted by US FDA on statins and the risk for increased blood sugar and cognitive side effects.

Table V.3 - Drug label sections updated by regulatory authorities

More than one section of the drug label could have been updated. Regulatory authorities could have decided to remain the suspected drug(s) under revision despite labeling changes have been carried out.

#### **V.5. DISCUSSION**

The results of this study provide evidence that in the cases of the safety alerts assessed herein regulatory authorities reviewed, either isolated or in combination, several sources of information to support their decisions on safety issues associated with the most widely consumed drug classes in ambulatory care, including published and non-published data. Such sources of information mainly comprised post-marketing spontaneous reports and experimental and observational clinical studies.

Spontaneously notified reports of cases were present in the majority of the benefit/risk ratio reassessments, with a considerable proportion (20%) of safety evaluations conducted exclusively on this source of evidence. This seems to be the case for rare and previously unsuspected situations (WYSOWSKI and SWARTZ, 2005). Such events are prone to be reported by healthcare professionals or patients when they occur within a relatively short period of time after the initiation of the treatment or following a dose increment (MADRE et *al.*, 2006).

The results of this study are similar to those found in other studies, thereby confirming the value of the pharmacovigilance spontaneous reporting systems in providing evidence on iatrogenic risk (MOORE, SINGH and FURBERG, 2012; LESTER et al., 2013). One previous study demonstrated that the results from this surveillance system have provided evidence of serious safety problems, leading not only label changes but also to the withdrawal of drugs from the market (WYSOWSKI and SWARTZ, 2005). Reports of cases may be the only available evidence suggesting an association between a suspected drug and an AE, since no further studies may have been conducted or, if conducted, their results may preclude any definitive conclusions (Us FOOD AND DRUG ADMINISTRATION, 2009; DORE, SEEGER and CHAN, 2009; GARG, CHEN, and PENDERGRASS, 2010; DORE et al., 2011). In such cases, regulatory authorities may require risk minimization programmes to prevent more patients from being exposed to unnecessary risk (US FOOD AND DRUG ADMINISTRATION, 2009). However, voluntary reports of suspected adverse drug reactions have limitations. The quality of the data reported may be low, and some events may be more frequently reported than others, such as those which are rare and serious. Additionally, a drug may be subject to an increased number of reports in the early years after being granted a market authorization (AHMAD, MARKS and GOETSCH, 2006). Such limitations lead post-marketing spontaneous

reports to be considered as generating hypotheses rather than confirming them, and additional analytic studies may be required to better assess the safety profile of a drug.

In this study, evidence from RCTs supported a significant number of regulatory decisions. When RCTs constituted the only source of evidence, it was not uncommon that the AE was an end-point of interest of the study (e.g. QT interval prolongation, bleeding, mortality). Clinical trials are considered to be the most reliable source of scientific evidence that can support healthcare policies and clinical practice (GUYATT et al., 2008). However, the majority of RCTs are designed to evaluate the most common AEs occurring early on the treatment.

Observational studies are more likely to be involved in the detection of long-term latency AEs. Moreover, this type of data may better represent the frequency of harmful effects experienced in actual clinical practice (PAPANIKOLAOU, CHRISTIDI and IOANNIDIS, 2006; VANDENBROUCKE and PSATY, 2008). Several regulatory decisions on AEs occurring with a long-latency time from the initiation of the treatment, such as fractures, cardiovascular events or malignancies, were found to be based on observational designs, the majority being cohort and case-control studies. Despite a considerable proportion of the safety alerts being supported by RCTs (41%), this study found that observational data made a relevant contribution towards supporting safety issues, not only in postmarketing reports of cases (56%) but also in longitudinal studies [cohort (27%) case-control (22%)] and case reports/case-series (17%). Since only the most consumed classes of medicines were included in this work, the probability of these drugs being the subject of observational studies is high. Moreover, it is expected that the contribution of observational data to label updates due to safety issues may increase due to the adoption of electronic health records (LESTER et al., 2013).

The quality of the evidence supporting regulatory decisions on drug safety has been discussed (MOORE, SINGH and FURBERG, 2012; WOLFE, 2012; DAL PAN and TEMPLE, 2012). Methodological limitations of the studies may impair causality assessment; this was the conclusion of the EMA on the association between antiepileptic drugs and bone disorders. Most of the regulatory decisions presented in this work were based on the evaluation of evidence which was not immediately published in the scientific literature or which is difficult to access by the scientific community, such as the post-marketing spontaneous reports or studies requested from market authorization holders. As such, the regulatory authority is in an unmatched position to conduct critical analyses. However, access to unpublished data may allow independent investigators to conduct secondary assessments on specific safety

#### Chapter V

issues and to clarify important questions, as it was the case for selective serotonin reuptake inhibitors in the treatment of depression in children (WHITTINGTON *et al.*, 2004). Moreover, analyses of postmarketing spontaneous reports compiled in databases of regulatory authorities, such as the FDA, by other investigators have led to the generation of safety signals and the production of scientific literature, thereby proving to be a good strategy in drug safety monitoring (POWERS and COOK, 2012).

Surprisingly, only three of the 59 safety signals studied, were simultaneously raised and evaluated by all four regulatory agencies assessed in this study: pioglitazone and bladder cancer, combined hormonal contraceptives containing drospirenone and venous thromboembolism and citalopram and QT interval prolongation. The vast majority of these drugs were approved in the countries regulated by the four authorities, with the exception of tinzaparin and ketoprofen containing drugs used topically. Since a given alert, which leads to a further regulatory action, can be considered a safety issue by one agency and not by another agency, similar populations may be at different levels of risk due to regulatory decisions. Moreover, when the same safety issues were simultaneously evaluated by more than one agency, decisions were taken within different time frames, as was the case for proton pump inhibitors and bone fractures or hypomagnesemia, pioglitazone or escitalopram, with a difference of several months. A study conducted by Hirst and colleagues (2006) described some examples of different regulatory actions conducted for the same medicines in different countries - however, in this study discrepancies in label changes were rare.

Although guidelines have been developed to harmonize pharmacovigilance activities worldwide, differences in healthcare systems, regulatory procedures and even in culture may contribute to risk management strategies varying across countries (HIRST *et al.*, 2006; US FOOD AND DRUG ADMINISTRATION, 2013; PFISTERMEISTER *et al.*, 2013). Additionally, surveillance of all approved drugs and their potential adverse reactions in an active way may not be feasible due to restrictions in human resources and/or budget (WYSOWSKI and SWARTZ, 2005; HIRST *et al.*, 2006). Cooperative agreements may be established between regulatory authorities to monitor various activities, including discussions of safety issues, exchange of pharmacovigilance information and collaboration in conducting studies to clarify safety issues (EUROPEAN MEDICINES AGENCY, 2013a; EUROPEAN MEDICINES AGENCY, 2013b; STANG, M.; WYSOWSKI, D.K.; BUTLER-JONES, 1999). Despite guidance and cooperation, differences in safety regulation between major regulatory authorities still exist, such as the discrepancies in drug label updates conducted by FDA and EMA on the cardiovascular safety

of non-selective non-steroids anti-inflammatory drugs - decisions which were based on the same scientific evidence (FURBERG, 2007). As Hirst and colleagues (2006) previously stated, since the methods applied for evaluating benefit/risk ratio may not be comparable, inconsistent regulatory action around the world may be inevitable.

Most of the label changes identified in our study resulted in an update of the Warnings and precautions section, with only two boxed warnings being added and a marketing authorization being suspended. Similar studies on this subject identified more boxed warnings added to labels (MOORE, SINGH and FURBERG, 2012; LESTER *et al.*, 2013). The majority of the drugs included in this study have been marketed for several years almost worldwide and have thus been used to treat millions of people. Recently approved drugs may be more likely to be associated with unknown and serious adverse drug reactions. A previous study found that half of drug withdrawals occur within 2 years after a market authorization has been granted and that half of major label changes (defined as "drug withdrawal" or "black box warning inclusion") occur within 7 years after drug approval (LASSER *et al.*, 2012). Additionally, changes in drug development that have led to important safety issues being taken into consideration may also have led to drug withdrawal due to common causes, such as hepatotoxicity or cardiovascular toxicity, to have become less likely (TEMPLE and HIMMEL, 2002).

This study has a number of limitations. Regulatory agencies other than FDA, Health Canada, EMA and Australian TGA were not searched. Websites posted in languages other than English were not considered, which could have resulted in the exclusion of important information. We analysed safety alerts and communications which included early notices on safety issues and, therefore, some of these continue to be under revision at this time, without as yet any final decision by the authorities; additionally, information on data sources and regulatory actions may not be published in their entirety. Safety signals generated through the analysis of postmarketing spontaneous reports databases were not specifically searched since such information should be confirmed by the authorities due to its uncertainties.

Regulatory authorities continuously review the benefit/risk ratio of a drug throughout its entire life time, taking into account that data sources which are available will differ substantially. During the post-marketing phase, once an AE is possibly associated with drug treatment, regulatory authorities assess the extent to which it may be a threat to public health (MADRE *et al.*, 2006). Postmarketing spontaneous reporting systems have been shown to be a valuable resource by which to identify suspected adverse drug reactions, especially

Chapter V

those which are rare and serious. Harmonization between regulatory authorities of different regions should be the subject of further efforts in order to expedite the decision-making process and to understand the reason(s) for the differences in the length of time involved in the regulatory safety decision process.

# **CHAPTER VI – DRUG-SAFETY ALERTS ISSUED BY**

# **REGULATORY AUTHORITIES: USEFULNESS OF**

## **META-ANALYSIS IN PREDICTING EARLIER RISKS**

## VI. DRUG-SAFETY ALERTS ISSUED BY REGULATORY AUTHORITIES: USEFULNESS OF META-ANALYSIS IN PREDICTING EARLIER RISKS

### VI.I. ABSTRACT

To evaluate how risk estimates generated from cumulative meta-analysis performs over time for drugs having their benefit/risk ratio reevaluated due to safety issues and, additionally, assess if the results are consistent with regulatory authorities' conclusions. Four major regulatory authorities were searched for their issued safety alerts which have been supported by longitudinal, comparative studies (experimentals and/or observationals). Random-effects model was used to pooled ORs over time, by including studies according to the year they first became available. Seventeen safety alerts were included in this study. In 2008, proton pump inhibitors were associated with an increased risk for bone fractures (OR 1.25, 95% CI 1.00-1.55, P=0.049); FDA issued a safety alert in 2010 and added warnings to label. An increased risk for Clostridium difficile associated diarrhea was pooled for proton pump inhibitors in 2004 (OR 1.89, 1.19-3.02, P=0.007); FDA issued a safety alert in 2012, adding warnings to label. Proton pump inhibitors were associated with pneumonia in 2009 (OR 1.40, 1.06-1.85, P=0.017); FDA issued an alert in 2012 but concluded that B/R ratio remains positive. Statins were associated to an increased risk for diabetes (OR 1.07, 1.01-1.15, P=0.033) in 2008. EMA issued an alert in 2012, including warnings to label. The remaining cumulative meta-analyses have not estimated increased risks in advance to regulatory decisions. This study demonstrates that meta-analysis may help predicting iatrogenic risks. However, between-studies heterogeneity can considerably affect the estimated results and, therefore, this technique should not replace further assessments during benefit/risk ratio reevaluations.

## **VI.2. INTRODUCTION**

After a medicine has been issued a market authorization and became available, unknown ADRs can arise from the everyday practice (MADRE et al., 2006). This additional knowledge of the safety profile deserves to be carefully evaluated for the protection of patients (MADRE et al., 2006). Some ADRs are serious enough to change the benefit/risk profile of a particular drug, leading to restriction on its use or even market withdrawal (MOORE, SINGH and FURBERG, 2012). In order to keep the patients and health care professionals updated, authorities frequently issue drug safety alerts informing about benefit/risk ratio reevaluations being conducted and subsequent regulatory decisions (US FOOD AND DRUG ADMINISTRATION, 2013; EUROPEAN MEDICINES AGENCY, 2013).

Clinical trials provide the best design to evaluate the efficacy of drug and its most common adverse effects (WYSOWSKI and SWARTZ, 2005; MEDICINES AND HEALTHCARE PRODUCTS REGULATORY AGENCY, 2011). However, not all harmfull effects can be easily anticipated in RCTs, and even if measured their reporting is usually inadequate. Observational studies usually support regulatory decisions on rare and/or long latency AEs, such as fractures, cardiovascular events or malignancies (VAN STAA, LEUFKENS and COOPER, 2001).

Different types of epidemiological data support pharmacovigilance activities, and its collection and evaluation are crucial steps for regulatory authorities in order to establish the most accurate benefit/risk ratio (PAPANIKOLAOU, CHRISTIDI and IOANNIDIS, 2006; US FOOD AND DRUG ADMINISTRATION, 2012). Post-marketing drug safety surveillance can be considered a dynamic prospective process that requires timelier ascertainment of drug risks together with higher quality and better documented scientific evidence (MADRE *et al.*, 2006). Therefore, a considerable period of time can separate the arising of evidence supporting the association between a new AE and a drug exposure, leading to a decision from regulatory authorities.

Meta-analysis provides the conceptual and quantitative framework for rigorous literature review, combining effect measures when appropriate and allowing an objective presentation and analysis of the available data (KIM and BERLIN, 2006). This technique has been commonly used to pool data from RCTs mainly to evaluate efficacy endpoints (ALVES, BATEL-MARQUES and MACEDO, 2012a) Despite not frequently used to evaluate safety issues, the meta-analytic cumulative analysis of evidence has demonstrated that appropriate and

timely decisions could have been taken concerning cardiovascular events associated with rofecoxib (JÜNI et al., 2004).

This study is aimed to evaluate how risk estimates generated from cumulative metaanalysis performs over time for drugs having their benefit/risk ratio reevaluated due to safety issues and, additionally, assess if the results are consistent with regulatory authorities' conclusions.

## **VI.3. METHODS**

#### VI.3.1. SAFETY ALERTS SELECTION

A previous study reviewed the type and publication status of data sources supporting benefit/risk ratio reevaluations conducted by FDA, Health Canada, EMA and Australian TGA (ALVES, MACEDO and BATEL MARQUES, 2013). A total of 59 safety alerts were evaluated. Only safety alerts regarding the evaluation of a causal relation between a suspected drug exposure and the occurrence of an AE which have been issued for the first time between January 2010 and December 2012 were considered for inclusion. Natural and healthcare products, medical devices, contrast agents, drug-drug interactions, drug-food interactions, medication errors, evaluations of lack of efficacy and AEs occurring during off-label use were not considered for inclusion. Only safety alerts concerning drugs with market authorization and simultaneously included in one of the thirty most prescribed drug classes worldwide used in the ambulatory setting were considered for inclusion. The complete methodology by which the safety alerts have been selected is described in the previous study (ALVES, MACEDO and BATEL MARQUES, 2013).

This study only included safety alerts in which regulatory authorities' decisions were supported by longitudinal, comparative studies [RCTs and/or observational studies (cohort or case-control)]. Studies included in meta-analyses used to support regulatory decisions were retrieved and pooled in the respective cumulative meta-analyses. No further bibliographic references were requested to regulatory authorities beyond those published in the websites. Bibliographic electronic searches were not conducted.

The following information from each safety alert was extracted: (1) date of first publication; (2) regulatory authority issuing the safety alert; (3) suspected drug(s); (4) AE; (5) type of studies supporting the evaluation; (6) drug label' section(s) updated. "Benefit/risk ratio unchanged" was considered when no change was performed.

Updates of the same safety alert were reviewed in order to retrieve further information. Two safety alerts were considered to be evaluating the same clinical question when they assessed the same AE for the same suspected drug(s). Clinical question is referring to the investigational hypothesis evaluated by a regulatory authority. Regulatory authorities could have decided to remain the suspected drug(s) under revision despite labelling changes have been carried out.

#### VI.3.2. META-ANALYSIS

For each clinical question, a cumulative meta-analysis was performed for the outcome of interest to display the pooled evidence over time. In the cumulative meta-analysis the studies were included according to the year they first became available – i.e., the earliest of: online publication date (Epub ahead of print date) or the correspondent journal issue publication date. Studies must have provided risk estimates (RR, OR, or HR) for patients treated with the suspected drug compared with a control group, or data allowing calculation of such risk estimates. The most adjusted estimate was used for studies presenting more than one risk estimate. A minimum of three studies was needed in order to carry on a cumulative meta-analysis.

Meta-analyses were conducted using the DerSimonian and Laird random-effects model in order to pool the OR with their 95% CIs (DERSIMONIAN and LAIRD, 1986). It was assumed that OR was an unbiased estimate of the RR. This model was chosen since it is more conservative than a fixed-effect model in the presence of between-studies heterogeneity. Between-studies heterogeneity was assessed by calculating a chi-square test and the l<sup>2</sup> measure of inconsistency (HIGGINS *et al.*, 2003). The influence of studies' publication date over the primary outcomes' risk considered in each safety alert was assessed by means of a meta-regression, according to the method of moments. The publication bias was visually examined by a funnel plot and statistically evaluated by Egger's regression asymmetry test (BORENSTEIN *et al.*, 2009; EGGER *et al.*, 1997). A sensitivity analysis was performed to explore the influence of studies' design in the summary estimates.

All statistical analyses were performed using the Comprehensive Meta-analysis Version 2 (Biostat, Englewood, NJ, USA).

### VI.4. RESULTS

Figure VI.1 summarizes the selection process of the safety alerts. Of the 59 safety alerts, 39 were excluded since they were not supported by longitudinal, comparative studies. Twenty safety alerts were selected for further revision, of which three were excluded: valproate and impaired cognitive development since the revised studies did not provide data to calculate RR estimates; lamotrigine and increased risk of sudden unexpected death since any death occurred in studies where patients were treated with lamotrigine; and antiepileptics and bone disorders since a considerable proportion of studies compared patients with epilepsy receiving treatment with healthy individuals.

The characteristics of the safety alerts included are described in Table VI.1. The 17 safety alerts evaluated 9 different clinical questions. Two clinical questions (statins and increased blood sugar; statins and cognitive side effects) were evaluated by FDA in the same safety alert released on 28-02-2012. Four clinical questions were evaluated by only one regulatory authority. Five clinical questions were evaluated by at least two regulatory authorities.

Table VI.2 describes the results of cumulative meta-analyses over time according to the year of publication of each study, the meta-regression estimates and publication bias assessment.

Fluoxetine and cardiovascular birth defects

Fluoxetine was not associated with a significant risk for cardiovascular birth defects development (final result OR 1.19; 95% CI 0.86-1.65, P=0.304; I<sup>2</sup>=28.3%, P=0.21). Only two studies reported an increased risk (Supplemental Data VI.1 References 1,4).

### Protons pump inhibitors and bone fractures

A statistically significant increased risk for bone fractures associated with proton pump inhibitors was initially identified in 2006 by pooling data from 2 studies (OR 1.31, 95% CI 1.08-1.59, P=0.007). In 2008, the risk became not statistically significant (OR 1.18, 95% CI 0.93-1.48, P=0.169) with the publication of Kaye et al. (2008) (Supplemental Data VI.1 Reference 15). In the same year, a statistically significant association could be pooled from studies after the publication of Targownik et al. (2008) (Supplemental Data VI.1 Reference 16) (OR 1.25, 955 CI 1.00-1.55, P=0.049) as well as to the final result (OR 1.27, 95% CI 1.17-1.37, P<0.001;  $l^2$ =77.0%, P<0.001).

#### Angiotensin receptor blockers and cancer

Angiotensin receptor blockers are not associated with an increased risk for cancer (final result OR 0.99, 95% CI 0.95-1.05, P=0.674;  $I^2=0\%$ , P=0.49). Meta-regression showed that the results were stable over time [Estimate (SE) 0.001 (0.006); P=0.85].

#### Pioglitazone and bladder cancer

A statistically significant risk for bladder cancer associated with pioglitazone was identified after the publication of the first study on 2012 (OR 1.24, 95% CI 1.04-1.48, P=0.012) and remained significant when the results of all studies were pooled (OR 1.32, 95% CI 1.08-1.62, P=0.020;  $l^2$ =37.4%, P=0.19).

Combined hormonal contraceptives containing drospirenone and venous thromboembolism

Two early studies published in 2007 didn't report an increase in the risk between combined hormonal contraceptives containing drospirenone venous thromboembolism. Later studies established an increased risk which is confirmed in 2011 by meta-analysis [OR 1.70, 95% CI 1.13-2.57, P=0.011; I<sup>2</sup>=81.0%, P<0.001; meta-regression estimate (SE) = 0.22 (0.12); P=0.06].

# Statins and increased blood sugar

The outcome of interest evaluated was "newly-diagnosed diabetes mellitus". The cumulative meta-analysis of studies in 2008 associated statins with an increased risk for diabetes mellitus (OR 1.07, 95% CI 1.01-1.15, P=0.034). The result became statistically non-significant after data from a cohort study being pooled (OR 1.11, 95% CI 0.99-1.23, P=0.055;  $I^2$ =72.7%, P<0.001) [meta-regression estimate (SE) = 0.02 (0.006); P<0.001] (Supplemental Data VI.1 Reference 73).

# Protons pump inhibitors and Clostridium difficile associated diarrhea

Cumulative meta-analysis showed that statistically significant increased risk for Clostridium difficile associated diarrhea with proton pump inhibitors became evident when the fifth study was published in 2005 (OR 1.89, 95% CI 1.19-3.02, P=0.007). Final OR estimates was 1.94 (95% CI 1.61-2.37, P<0.001; I<sup>2</sup>=87.9%, P<0.001).

### Statins and cognitive side effects

A protective effect of statins on dementia and cognitive impairment was found (OR 0.65, 95% CI 0.43-0.98, P=0.039;  $I^2$ =75.9%, P<0.001). Meta-regression showed that the results were stable over time [Estimate (SE) -0.0008 (0.06), P=0.99].

#### Proton pump inhibitors and pneumonia

Cumulative meta-analysis showed that statistically significant increased risk for pneumonia associated with proton pump inhibitors became evident when the third study was published in 2007 (OR 1.56, 95% CI 1.31-1.87, P<0.001). However, when the study of Roughead et al. was published in 2009, the result became statistically non-significant (OR 1.37, 95% CI 0.99-1.89, P=0.055) (Supplemental Data VI.1 Reference 154). Following the publication of Myles et al. (2009) an increased risk was observed again (OR 1.40, 95% CI 1.06-1.85, P=0.017) (Supplemental Data VI.1 Reference 150). The final OR for cumulative meta-analysis was 1.35 (95% CI 1.13-1.61, P=0.001;  $I^2$ =95.7%, P< 0.001).

Notes: \* - issued in the same safety alert;

#### VI.4.1. PUBLICATION BIAS

Egger's asymmetry test was not statistically significant for most of the analyses but was significant for the analysis of statins and increased blood sugar (P=0.003) (Table 2). After the exclusion of the cohort study, no statistically significant asymmetry was found (P=0.773) (Supplemental Data VI.1 Reference 73). Few studies were considered for pioglitazone and bladder cancer analysis, which may not allow firm conclusions despite the non-statistically significant Egger's asymmetry test (P=0.07). Subjective evaluation of publication bias was based on the visual inspection of funnel plot.

### VI.4.2. SENSITIVITY ANALYSIS

The sensitivity analysis according to different study designs did not significantly change the results with respect to the observed between-studies heterogeneity (Supplemental Data VI.2). Regarding the sub-group analysis according to the studies design, three pooled risk estimates changed their timing. When only RCTs were considered to estimate the risk for increased blood sugar (newly-diagnosed diabetes mellitus) associated with statins, the estimate yielded a statistically significant increased OR (1.07, 95% CI 1.01-1.15, P=0.034). The same increased risk was observed in the cohort study, although the final pooled estimate of different study designs was non-significant (Supplemental Data VI.1 Reference 73). For the risk estimate considering only cohort designs, the ultimate increased risk for diarrhea due to Clostridium difficile associated with proton pump inhibitors was only observed in 2009 (OR 1.75, 1.00-3.07, P=0.05). The definitive increased risk for fractures associated with proton pump inhibitors was observed in 2010 (OR 1.23, 1.07-1.40, P=0.003) when only case-control studies were considered.

# **VI.5. DISCUSSION**

The findings of this study show that, for the majority of case scenarios (7/9), the results yielded by meta-analysis were in line with the conclusions of the regulatory authorities. Warnings could have been added to the label of proton pump inhibitors in 2004 for Clostridium difficile associated diarrhea and in 2008 for bone fractures. The label of proton pump inhibitors was subject of first updates in 2012 and 2010 regarding those AEs, respectively. These two decisions were supported by observational data only. Increased blood sugar was associated with statins in 2008 after pooling data from RCTs. The inclusion of a cohort study in the estimate returned a final result which is statistically non-significant and associated with considerable heterogeneity. Statins' label was updated to properly advise users for the risk of diabetes.

However, caution is needed when interpreting these risk estimates since they could be biased by the inherent confounding variables of the included studies (KIM and BERLIN, 2006). According to the results of the sensitivity analysis, meta-analyses exclusively integrating data from RCTs had their results characterized by low heterogeneity. Frequent and acute AEs are regularly identified from RCTs, in particular when they are pre-established endpoints of interest. When regulatory authorities and investigators are dealing with rare AEs which may be present in RCTs, it is frequent to pool data using meta-analysis. This was the case when AEs as cancer and increased blood sugar were evaluated using meta-analytic technique (BANGALORE et al., 2011; SATTAR et al., 2010; SIPAHI et al., 2010).

All the safety issues studied in this work were evaluated by at least one type of observational methodology when regulatory authorities reviewed their benefit/risk ratio. This could be due to the fact that most of these AEs being considered as rare and/or long-latency events, such as malignancies, cardiovascular events or diabetes, which are prone to be better evaluated in post-authorization safety studies. These studies offer the advantage of a naturalistic observation, which may better represent the incidence of iatrogenic events occurred in the clinical practice (PAPANIKOLAOU, CHRISTIDI and IOANNIDIS, 2006; VANDENBROUCKE and PSATY, 2008).

The final conclusion of benefit/risk reevaluations conducted by the regulatory authorities may contradict risk estimates pooled by meta-analytic technique. Additional data sources supporting a causal relation between an AE and a drug can be used to substantiate regulatory decisions. In cases like this meta-analyses of the existing evidence can return inconclusive results, as it was when the authorities decided to include warnings in the label

of GLP-1 receptor agonists due to acute pancreatitis risk (ALVES, BATEL-MARQUES and MACEDO, 2012b). In this study, an increased risk of pneumonia associated with proton pump inhibitors was estimated in 2009. This is in line with the results of previous meta-analyses which yielded increased risk estimates and were subsequently reviewed by EMA (EOM et al., 2011; GIULIANIO, WILHELM and KALE-PRADHAN, 2012; JOHNSTONE, NERENBERG and LOEB, 2010). However, EMA recommended that no risk minimization activities should be taken at the moment and kept this class under review. The authority considered that evidence from observational studies of an association between proton pump inhibitors as a class and pneumonia was inconsistent and might be subject to residual confounding (EUROPEAN MEDICINES AGENCY, 2012). Methodological differences may also be responsible for delays in meta-analysis to yield a statistical significant result, as it was for venous thromboembolism associated with oral contraceptives containing drospirenone. Differences between venous thromboembolism definition, risk factor of included patients and type of contraceptives used as control group may explain why the first two studies published in 2007 reported a null association (IICK and HERNANDEZ, 2011). Latter studies took these methodological and clinical issues into consideration and reported increased risks (JICK and HERNANDEZ, 2011). This may help to explain why only in 2011 an increased risk was pooled by cumulative metaanalysis, the same year that all regulatory authorities suggested labels' updates.

According to meta-regression results, most of the risk estimates were stable over time. The exception was statins and increased blood sugar for which the risk progressively increased. This may suggest that conducting cumulative meta-analysis of evidence could have help regulatory authorities to take more timely decisions. Previous studies estimated that drug withdrawals from market occur in the first 2 years and that label changes take, on average, between 7 to 11 years (MOORE, SINGH and FURBERG, 2012; LESTER et al., 2013; LASSER et al., 2002). This study included the most consumed drugs worldwide in the ambulatory care which are approved by several years and have been used to treat millions of people. Recent approved drugs may be more likely to be linked with unexpected serious AEs leading to their more rapidly regulatory actions. In this study, none of the regulatory decisions led to drugs withdrawal. Postmarketing drug safety requires careful evaluation of the existing evidence by regulatory authorities. However, timely ascertainment of drug risks with higher quality and better documented scientific evidence seems to deserve improvement (MOORE, SINGH and FURBERG, 2012).

Taking into account the safety issues evaluated in this study and the correspondent regulatory decisions, it is not possible to draw definitive recommendations about the

#### Chapter VI

requirements of conducting meta-analyses every time safety signals are issued from data of longitudinal, comparative studies. Observational studies are more susceptible to bias and confounding and integrating data from such designs in meta-analyses may return results with excessive heterogeneity, as it was observed for most of the cases evaluated. In the attempt to reduce such uncertainty, a sensitivity analyses based on study designs was conducted but the results did not differ significantly. When there is little heterogeneity among studies, one may be willing to accept meta-analytic evidence as helping to establish a benefit/risk ratio (KIM and BERLIN, 2006). In the presence of substantial heterogeneity is difficult to draw conclusions and the acceptance of the results may be slow. This might be one of the reasons why regulatory authorities can take several years to conclude on an increased risk in some cases addressed in this study.

Some limitations need to be noted. The safety issues addressed in this study were evaluated by four major regulatory authorities. Others beyond those authorities were not searched for safety alerts. This could result in the exclusion of important information. This study intended to analyze safety alerts and communications which included early notices about safety issues, continuing some of them under revision at this time and without being known the authorities final decisions. Only the bibliographic references used as sources of information by the regulatory authorities to support safety alerts were considered for this study. Systematic reviews of bibliographic evidence for each clinical question were not conducted; additionally, all data sources reviewed by regulatory authorities may not have been completely published in their websites. Therefore, some studies may be absent from the cumulative meta-analyses. Despite Egger's asymmetry test and visual inspection of funnel plots may not indicate publication bias for most of the cases, turning these assessments difficult since no specific bibliographic researches have been conducted. However, the extent to which regulatory authorities have taken into account all the published scientific evidence when a benefit/risk ratio is evaluated due to a safety issue was not subject of this study.

The role of meta-analysis in pharmacovigilance is a matter of ongoing debate, and efforts are being made to develop guidelines on the use of meta-analysis in drug safety assessments (COUNCIL FOR INTERNATIONAL ORGANIZATIONS OF MEDICAL SCIENCES, 2013). However, there are a number of methodological considerations needed to take into account when designing and conducting meta-analyses, in particular when observational studies are included, in combination with RCTs or in exclusive (KIM and BERLIN, 2006; COUNCIL FOR INTERNATIONAL ORGANIZATIONS OF MEDICAL SCIENCES, 2013). Assessment of medicines' benefit/risk ratio after a safety issue has been raised is a highly responsible scientific exercise

that should be supported by different sources of scientific evidence, sometimes with conflicting results. Nonetheless, the quality of the meta-analysis is of high importance when safety policy measures need to be taken (KIM and BERLIN, 2006). Although regulatory authorities and independent investigators may identify increased iatrogenic risks for some drugs previous to official risk minimization strategies be set on, uncertainties due to the presence of heterogeneity or even the inclusion of different study designs may delay the decision-making process. In conclusion, this study demonstrates that meta-analysis can be useful to assess drug-AE' causal relations and, therefore, is able to predict earlier iatrogenic risks. Although cumulative meta-analysis has been used to evaluate how risk estimates perform over time with success, as in the case of rofecoxib, the results can be affected by considerable heterogeneity (JÜNI *et al.*, 2004). Therefore, this technique does not replace further assessments during the benefit/risk ratio evaluation procedure.

# **CHAPTER VII – GENERAL DISCUSSION**

#### VII. GENERAL DISCUSSION

# VII.I. DISCUSSION

Despite each experimental chapter has its own discussion, this section is intended to discuss in a more integrated and broader manner all the research studies presented in this thesis. The work conducted under the presented thesis aims at answer to the general objectives proposed at the beginning of this dissertation.

The knowledge about the risk profile of a medical intervention is as important as its benefits. Both are crucial to establish the most accurate medicine's benefit-risk profile. The majority of newly introduced medical interventions have small, incremental benefits when compared with available treatments (IOANNIDIS, 2009). Therefore, differences in safety profiles should have a key role in the treatments choice (IOANNIDIS, 2009).

Regarding a pharmacologic intervention, most of the information on its safety profile is produced during the pre-market clinical development. However, rare and serious AEs are usually identified through observational pharmacovigilance activities after a drug being introduced into the market (WYSOWSKI and SWARTZ, 2005; LASSER *et al.*, 2002). Since observational studies are based on real world clinical data, they may better reflect the frequency of AEs (VANDENBROUCKE, 2004; VANDENBROUCKE, 2006). Systematically reviewing of both experimental and observational data on safety may provide a more balanced and realistic account of the likeliwood of the outcomes (HOPEWELL, WOLFENDEN, and CLARKE, 2008).

Investigate uncommon or long-term AEs associated with pharmacological treatments is an important application of meta-analysis. However, combining data from different study designs through meta-analytic technique can be affected by inherent biases of the considered studies (KIM and BERLIN, 2006; BERLIN, CEPEDA and KIM, 2012). Taking into account these considerations and the objectives of this work, the first task conducted was the identification and the evaluation of meta-analyses from both experimental and observational studies where safety was found to be an outcome measure. The search was limited to meta-analyses published in eight medical journals from 2005 to 2010 which were selected for having the highest impact factor on the area of general/internal medicine.

According to the findings, only a limited number of meta-analyses are currently devoted to evaluate the safety of pharmacological interventions. The majority of the 438

Chapter VII

meta-analyses identified during the 5-years studied period was designed to assess efficacy or non-pharmacological interventions, while only 60 (14%) assessed drug safety as a primary outcome. It should be noted that some meta-analyses evaluated the same clinical question during the studied period since some treatments were under evaluation by regulatory authorities (e.g., risk of cardiovascular events associated with rosiglitazone; antidepressants and risk of suicidal behaviors). This research identified meta-analyses devoted to evaluate the safety of pharmacological interventions. However, of the 60 meta-analyses evaluated, two included only observational studies and four included data from both observational and experimental studies. Moreover, of the meta-analyses which included different study designs, two compared to results pooled from RCTs with those pooled from observational studies, while in other meta-analysis observational studies were used to provide information on safety outcomes which was not reported in RCTs.

The relatively low number of meta-analyses including observational data may have been influenced by the choice of this set of journals. Journals covering the disciplines of pharmacoepidemiology and pharmacovigilance may publish relevant meta-analyses, some of those including different study designs as data sources (HENNESSY *et al.*, 2001; GAGNE, GRIESDALE and SCHNEEWEISS, 2009; LOKE, JEEVANANTHAM and SINGH, 2009; TOH and HERNÁNDEZ-DÍAZ, 2007; CHEN and ASHCROFT, 2006). Nonetheless, other reasons may exist too for such few meta-analyses designed to evaluate drug safety have been find. Despite extensive study in pre-approval RCTs of safety and effectiveness, doubts can remain about their effects, whether unintended, harmful or beneficial (PLATT *et al.*, 2014). Clinical trials are not designed to provide full assessments of drugs safety profiles. Additionally, most of the investigators may fear an increase in the uncertainty due to integrate data from both experimental and observational studies in meta-analyses. Therefore, these factors may contribute to the existence of a low number of meta-analyses dedicated to evaluate safety issues.

A previous study which randomly identified 60 meta-analyses published during 1995 found that 27 of them have included observational studies. However, only 11 meta-analyses were conducted to evaluate therapeutic interventions and no distinction was made between those evaluating efficacy or safety outcomes (EGGER, SCHNEIDER and DAVEY SMITH, 1998). The type of studies included in systematic reviews has also been described. Hopewell and colleagues (2008) found that Cochrane reviews included only RCTs (95%) for both efficacy and adverse outcomes. In contrast, systematic reviews published in the Database of

Abstracts of Reviews of Effects (DARE) were more likely to include other type of studies, with 58% relying only on experimental designs (HOPEWELL, WOLFENDEN, and CLARKE, 2008).

Meta-analyses of RCTs are based on the assumption that each trial provides an unbiased estimate of the effect of an experimental treatment and that the variability of the results between the studies is attributed to random variation (EGGER, SCHNEIDER and DAVEY SMITH, 1998). Thus, the overall effect measure pooled from a sample of RCTs will provide an essentially unbiased estimate of the treatment effect (EGGER, SCHNEIDER and DAVEY SMITH, 1998; EGGER, SMITH and PHILLIPS, 2007). This assumption is strengthened when a metaanalysis includes RCTs having similar designs, follow-up time duration, end-points assessment, and patient demographics. Randomized clinical trials are designed to provide evidence on the efficacious treatment of disease and tend to be under-powered for detection of AEs. (LESKO and MITCHELL, 2012; HAUSMANN, SCHNYDER and PICHLER, 2012). Unexpected and rare AEs may not be identified in RCTs conducted during clinical development. Moreover, adverse outcomes are not always reported in a consistent way. Therefore, evidence on safety reported by RCTs and their associated meta-analyses is often insufficient.

Although potential biases and confounding have to be considered, observational studies are more likely to include a broad representation of the population at-risk and provide reliable estimates of the incidence of AEs in clinical practice. Consequently, some AEs are only identified in observational studies, years after their introduction into the (STAFFA, CHANG and GREEN, 2002; LIDEGAARD *et al.*, 2009).

In this work, the safety of the direct inhibitors of coagulation factor Xa, rivaroxaban and apixaban, and GLP-I agonists, exenatide and liraglutide, was evaluated in two metaanalyses.

Most of the thromboprophylaxis after joint surgery consists in the use of heparins or vitamin K antagonists, such warfarin (GEERTS *et al.*, 2008). However, these therapies had specific limitations and new oral anticoagulant agents have been developed, like the direct inhibitors of coagulation factor Xa (WEITZ *et al.*, 2010; BECATTINI, LIGNANI and AGNELLI, 2010; GROSS and WEITZ, 2008). Both rivaroxaban and apixaban have shown to be effective in preventing thromboprophylaxis following knee and hip arthroplasty (LASSEN *et al.*, 2009; LASSEN *et al.*, 2010; ERIKSSON *et al.*, 2008; TURPIE *et al.*, 2009). Yet, the safety of rivaroxaban was subject of discussion in scientific literature due to doubts on the risk for haemorrhages and wound complications (JENSEN *et al.*, 2011; LOTKE, 2008; CAO *et al.*, 2010; GÓMEZ-OUTES *et al.*, 2009). Since rivaroxaban and apixaban have been developed almost at the same time, no

study directly compared both oral anticoagulants. Thus, a meta-analysis of RCTs was conducted in order to compare the safety profile of rivaroxaban and apixaban.

The results of the meta-analysis suggested that thromboprophylaxis with apixaban after knee arthroplasty was associated with a lower risk of major, clinical relevant nonmajor, and total bleeding events, when indirectly compared with rivaroxaban. When hip arthroplasty was the case, no differences were observed. A previous meta-analysis evaluating the efficacy and safety of rivaroxaban confirmed its superiority to enoxaparin as a thromboprophylaxis agent administered after joint surgery (CAO et al., 2010). However, the authors did not recommended the use of rivaroxaban since a higher proportion of bleeding events was observed in patients receiving it as a treatment. The RCTs of both drugs used either the European regimen of enoxaparin, 40 mg, subcutaneously, once-daily, or the North American regimen, consisting in administer enoxaparin 30 mg, subcutaneously, twice-daily. Therefore, a sensitivity analysis was conducted in order to establish comparisons using the European enoxaparin regimen. As a result, statistical significance disappeared and both apixaban and rivaroxaban presented an identical risk for bleeding. This is suggestive of a higher risk of bleeding associated with twice-daily enoxaparin 30 mg. Although both enoxaparin regimens have never been compared, this tendency for an increased risk of bleeding with enoxaparin 30 mg twice-daily regime was reported in a previous meta-analysis (HUANG et al., 2011).

The bleeding endpoints evaluated in this meta-analysis were the same as those prespecified in the RCTs. The assessment procedure and adjudication of AEs as well as followup times were the same in the phase III RCTs of rivaroxaban and apixaban. Additionally, the both drugs' clinical developments programmes included patients with similar demographic characteristics. The comparable design of studies evaluating apixaban and rivaroxaban as well as the fact that only data from well-defined outcomes has been pooled may have been responsible for the lower levels of heterogeneity observed throughout this meta-analysis.

Although this meta-analysis includes results of high-quality RCTs and includes data from a sample of more than 28 000 patients, not all the studies assessed safety outcomes considered to be relevant, such as wound infection, healing or drainage rates (JENSEN *et al.*, 2011; LOTKE, 2008). An observational retrospective study compared the safety of rivaroxaban with tinzaparin in patients submitted to knee or hip arthroplasty (JENSEN *et al.*, 2011). The results have shown that patients who received treatment with rivaroxaban were more than twice as likely to return to theatre with a wound complication. The authors

stated that they discontinued the use of rivaroxaban based on their results, raising the need for further RCTs assessing the efficacy and safety of rivaroxaban in clinical practice.

Serious AEs have been linked with exenatide and liraglutide, the first two GLP-I agonists being marketed. Since, 2005, cases of acute pancreatitis occurring in patients treated with exenatide BID have been spontaneously reported to regulatory authorities, mainly to FDA (US FOOD AND DRUG ADMINISTRATION, 2007). Analyses of spontaneous reporting systems' databases identified an increased risk for acute pancreatitis associated with exenatide BID (ELASHOFF *et al.*, 2011; RASCHI *et al.*, 2013). However, these findings were confirmed through observational longitudinal studies (DORE, SEEGER and CHAN, 2009; GARG, CHEN and PENDERGRASS, 2010; DORE *et al.*, 2011). Nonetheless, FDA decided for the update of exenatide product's labelling based on post-marketing spontaneously reported cases (US FOOD AND DRUG ADMINISTRATION, 2009). Acute pancreatitis was also identified in RCTs evaluating liraglutide (PARKS and ROSENBRAUGH, 2010).

Other serious adverse issue which has been linked with GLP-1 agonists is thyroid cancer, particularly associated with liraglutide. Benign thyroid C-cell adenomas were observed in rodents treated with exenatide BID but no carcinomas were reported (EUROPEAN MEDICINES AGENCY, 2006; DRUCKER *et al.*, 2010). In carcinogenicity studies, thyroid tumours occurred in rats administered with exenatide once-weekly (EUROPEAN MEDICINES AGENCY, 2011). During clinical development, unspecified neoplasms have been reported in patients treated with exenatide BID (EUROPEAN MEDICINES AGENCY, 2011). During clinical development, unspecified neoplasms have been reported in patients treated with exenatide BID (EUROPEAN MEDICINES AGENCY, 2006). C-cell hyperplasia and thyroid cancer were observed in pre-clinical toxicology studies conducted for liraglutide (EUROPEAN MEDICINES AGENCY, 2009; BJERRE KNUDSEN *et al.*, 2010). Thyroid neoplasms were also reported during the liraglutide RCTs (EUROPEAN MEDICINES AGENCY, 2009; PARKS and ROSENBRAUGH, 2010). Liraglutide's product label carries a Black Box warning noticing the risk for thyroid c-cell cancer (FOOD AND DRUGS ADMINISTRATION, 2010).

In order to evaluate the risk of acute pancreatitis, any cancer or thyroid cancer, associated with GLP-1 agonists, exenatide and liraglutide, a meta-analysis was carried out based on both experimental and observational published studies. The results suggest that neither exenatide nor liraglutide increase the risk for acute pancreatitis. These findings are in line with those reported in observational studies conducted for exenatide (DORE, SEEGER and CHAN, 2009; GARG, CHEN and PENDERGRASS, 2010; DORE *et al.*, 2011). No post-marketing observational studies evaluating acute pancreatitis have been identified for liraglutide.

Although no association between GLP-I agonists' exposure and acute pancreatitis has been established, several confounding factors should be considered. Nausea, abdominal discomfort and vomiting are ADRs known to be associated with GLP-I agonists treatment (EUROPEAN MEDICINES AGENCY, 2006; EUROPEAN MEDICINES AGENCY, 2011; EUROPEAN MEDICINES AGENCY, 2009). These events are symptoms of acute pancreatitis, which may impair patients to recognise it and could difficult health professionals to establish a proper diagnosis (BALANI and GRENDELL, 2008). Only studies exclusively evaluating patients with type 2 diabetes mellitus have been included in this meta-analysis. There is a higher risk for developing acute pancreatitis in patients suffering from type 2 diabetes, independently of the drug therapy (NOEL *et al.*, 2009). GLP-I agonists are more likely to be at more advanced stages of the disease and, therefore, more prone for developing acute pancreatitis. This may indicate that there is an increased risk for confounding by indication, particularly when observational studies are the case (NATHAN *et al.*, 2009; GARG, CHEN and PENDERGRASS, 2010).

This meta-analysis did not identify an increased risk for any cancer associated with exenatide. The results remained unchanged when the analysis was stratified according to the therapeutic regimens or different comparators. No significant difference in the risk for cancer was observed regarding treatment with liraglutide, except when the analysis was stratified based on studies methodological quality. When only five high methodological quality studies where considered, it was observed an increased risk of cancer from all causes in patients treated with liraglutide. Nonetheless, caution should be taken when interpreting this result, since is the only significant association found, suggesting a possible chance of finding. The scale of Downs and Black (1998) was chosen since it is able to assess both experimental and observational studies. The number of quality assessment scales that exist make it unclear how to achieve the best assessment and results may vary depending on the scale used (JÜNI *et al.*, 1999).

Although no consistent increased risk was found for both drugs, a divergence between the risk of cancer associated with exenatide and liraglutide was identified (-14% for exenatide and +35% for liraglutide, both non-significant). When only high quality studies were considered, this difference increases. Only RCTs were included in the meta-analysis evaluating the risk of cancer associated with GLP-1 agonists since observational studies were not identified in our search strategy. Considering that cancer is a long-latency event, the follow-up duration of the experimental studies may not be long enough to establish a reliable causality association between liraglutide exposure and cancer occurrence. Despite the few

cases identified during RCTs, the proportion of patients diagnosed with thyroid carcinomas was higher in those receiving liraglutide when comparing with those receiving any control treatment; no such cases were observed in patients receiving exenatide. The small number of cases and the lack of biological plausibility raise some doubts between the use of GLP-1 agonists, namely liraglutide, and thyroid cancer occurrence (DRUCKER *et al.*, 2010). Moreover, the effects of this drug in humans, particularly in the human thyroid gland, are unknown and difficult to be extrapolated from pre-clinical studies, despite the C-cell hyperplasia in rats (PAROLA, 2009). The findings of this meta-analysis enhance the need for long-term well-designed epidemiological studies devoted to assess the risk for cancer associated with GLP-1 agonists, including thyroid cancer during liraglutide exposure. Additional studies in animals and the establishment of a cancer registry database to monitor the incidence of medullary thyroid cancer associated with liraglutide was required by the FDA (PARKS and ROSENBRAUGH, 2010).

Some limitations should be considered in this meta-analysis. Few observational longitudinal studies evaluated these AEs. Although three cohort studies have been identified in literature, none observational study evaluating the risk of cancer was found. Since the follow-up time to properly assess these outcomes may take some years, the results of additional studies are expected in the near future. Of the 22 RCTs included, only one considered pancreatitis as an initial outcome measure. Despite two RCTa have evaluated the calcitonin levels, none of them were designed to prospectively monitor for malignancies. The absence of malignancies and/or pancreatitis as pre-defined diagnostic criteria can lead to missing events. Different controls were identified in the RCTs included in this meta-analysis and they might be associated with different risks for acute pancreatitis or cancer, such the case of gliptins or pioglitazone. Because of the heterogeneity of comparators and the relatively small number of acute pancreatitis and cancer events reported in the studies, the stratification of the results at this level is difficult. According to its EPAR, several neoplasms occurred in patients receiving treatment with exenatide BID during the clinical development programme, although the type of carcinomas has not been specified (EUROPEAN MEDICINES AGENCY, 2006). This suggests that publication bias may be present in our meta-analysis despites non-significant results observed for this outcome in the Egger's regression asymmetry test.

The significant between-studies heterogeneity observed for some comparisons established during the meta-analysis evaluating the risk for acute pancreatitis results from the inclusion of observational studies. Therefore, additional caution is needed when interpreting

such risk estimate results. Heterogeneity was considered low when only data from RCTs was included, as was the case of meta-analysis evaluating the risk of cancer or the previous meta-analysis evaluating the safety of coagulation factor Xa direct inhibitors. Nonetheless, due to the very low incidence of carcinomas, the final risk estimates confidence intervals for risk of cancer associated with GLP-1 agonists were found to be wider than those pooled when evaluating the safety of both rivaroxaban and apixaban.

Current available published evidence is insufficient to support an increased risk of acute pancreatitis or an increased risk of cancer from all causes associated with GLP-1 agonists. Since trials' size, duration and design may not be appropriate to accurately assess the risk of rare or long-term AEs, such acute pancreatitis or cancer, clinicians should rely on observational studies in future assessment of the risk of cancer. A rigorous monitoring of these outcomes should be implemented in the future studies since current evidence was not adequately designed to address this issue, precluding any definitive conclusion.

The contribution of meta-analysis for drug safety assessment could be measured through the extent in which regulatory authorities use this tool to support benefit/risk reevaluations. Therefore, a review was conducted in order to assess the type and publication status of data sources supporting benefit/risk ratio reevaluations conducted by four major regulatory authorities on safety issues evaluated between January 2010 and December 2012. The results of this study provide evidence that in the cases of the safety alerts assessed herein regulatory authorities reviewed, either isolated or in combination, several sources of information to support their decisions on safety issues. Such sources of information mainly comprised post-marketing spontaneous reports and experimental and observational clinical studies.

Spontaneously notified reports of cases were present in the majority of the benefit/risk ratio reassessments, with a considerable proportion (20%) of safety evaluations conducted exclusively on this source of evidence. Rare, severe and unexpected AEs, with an acute onset, are prone to be reported by healthcare professionals or patients when they occur within a relatively short period of time after the initiation of the treatment or following a dose increment (MADRE *et al.*, 2006). The value of the pharmacovigilance spontaneous reporting systems in providing evidence on iatrogenic risk is recognized (WYSOWSKI and SWARTZ, 2005; MOORE, SINGH and FURBERG, 2012; LESTER *et al.*, 2013). Reports of cases may be the only available evidence suggesting an association between a suspected drug and an AE. The warnings added to GLP-I agonists label by FDA regarding the

risk of acute pancreatitis were based on spontaneously reported AEs. The results of experimental and observational studies did not verify such increase in the risk, as well as the results of the meta-analysis conducted on that subject (EUROPEAN MEDICINES AGENCY, 2006; DORE, SEEGER and CHAN, 2009; GARG, CHEN and PENDERGRASS, 2010; DORE *et al.*, 2011).

Evidence from RCTs was found to support a significant number of regulatory decisions. For safety alerts where RCTs were found to be the only data sources consulted, it was not uncommon that the AE being evaluated was an end-point of interest of the study (e.g. QT interval prolongation, bleeding). In other way, several regulatory decisions on AEs occurring with a long-latency time from the initiation of the treatment, such as fractures, cardiovascular events or malignancies, were found to be based on observational designs, the majority being cohort and case-control studies. Although a considerable proportion of the safety alerts was supported by RCTs (41%), this study found that observational data also made a relevant contribution towards supporting safety issues, not only in post-marketing reports of cases (56%) but also in longitudinal studies [cohort (27%) case-control (22%)]. Since only the most consumed classes of medicines were included in this work, the probability of these drugs being the subject of observational research is high.

The results of meta-analyses have also been consulted by regulatory authorities to support their decisions, although not so frequently as other data sources. These were metaanalyses conducted using data from RCTs or from observational studies; none pooled data from both experimental and observational studies. When meta-analyses were evaluated, their results were consulted along with those of longitudinal comparative studies. None regulatory authority took decisions based exclusively on the results of meta-analyses. Metaanalysis is not frequently used to support regulatory decisions and, when it does, it is used mainly as a method to confirm the results found in longitudinal comparative studies, whether experimental or observational.

However, a number of limitations should be considered regarding these findings. Regulatory agencies other than FDA, Health Canada, EMA and Australian TGA were not searched and only websites posted in languages other than English were not considered, which may lead to the exclusion of relevant information. Additionally, information on data sources and regulatory actions may not be published in their entirety.

The meta-analytic technique has demonstrated its usefulness in evaluating safety issues. Cumulative meta-analysis has shown that appropriate and timely decisions could have been taken concerning cardiovascular events associated with rofecoxib (US FOOD AND DRUG ADMINISTRATION; 2011). In order to explore if meta-analytic technique would produce

reliable safety risk estimates that could lead regulatory authorities acting earlier than they did, we conducted an additional study. From the previous sample of safety alerts, only those in which regulatory authorities' decisions were supported by longitudinal, comparative studies were selected. The aim of this study was evaluating how risk estimates generated from cumulative meta-analysis performs over time for drugs having their benefit/risk ratio reevaluated and, additionally, assess if the results are consistent with regulatory authorities' conclusions.

The findings of this study show that, for the majority of the safety alerts subject of cumulative meta-analysis (7/9), the risk estimates were in line with the conclusions of the regulatory authorities. Moreover, cumulative risk estimates pointed out that warnings could have been added to the label of proton pump inhibitors in 2004 for Clostridium difficile associated diarrhea and in 2008 for bone fractures. It should be noticed that proton pump inhibitors' labels were subject of first updates in 2012 and 2010 regarding those AEs, respectively. Increased blood sugar was associated with statins in 2008 after pooling data from RCTs. The inclusion of a cohort study in the estimate returned a final result which is statistically non-significant and associated with considerable heterogeneity. Statins' label was updated to properly advise users for the risk of diabetes.

Nonetheless, caution is needed before taking conclusions from these results since they could be somehow biased due to the different study designs included (KIM and BERLIN, 2006; BERLIN, CEPEDA and KIM, 2012). A sensitivity analysis was conducted where the results were pooled according to different study designs, experimental and observational. Metaanalyses exclusively integrating data from RCTs were characterized by low between-studies heterogeneity. Frequent and acute AEs are regularly identified during RCTs, in particular when they are pre-established endpoints of interest. When regulatory authorities and investigators are dealing with rare AEs which may be present in experimental studies, it is frequent to pool data using meta-analysis. This was the case when AEs as cancer and increased blood sugar were evaluated (SATTAR *et al.*, 2010; SIPAHI *et al.*, 2010; VANDENBROUCKE and PSATY, 2008).

All the safety issues studied in this work were evaluated by at least one type of observational methodology when regulatory authorities reviewed their benefit/risk ratio. This could be due to the fact that most of these AEs being considered as rare and/or long-latency events, such as malignancies, cardiovascular events or diabetes, which are prone to be better evaluated in post-authorization safety studies. These studies offer the advantage of a naturalistic observation, which may better represent the incidence of iatrogenic events

occurred in the clinical practice (PAPANIKOLAOU, CHRISTIDI and IOANNIDIS, 2006; ALVES, BATEL-MARQUES and MACEDO, 2012).

Authorities' final conclusions of benefit/risk reevaluations may, in some cases, contradict meta-analytic' risk estimates. Additional data sources supporting a causal relation between an AE and a drug can be used to substantiate regulatory decisions. In such cases, meta-analyses of the existing evidence can return inconclusive results, as it was previously studied for GLP-I receptor agonists which had labeling updates based on spontaneously reported cases of acute pancreatitis (EOM et al., 2011). In this study, an increased risk of pneumonia associated with proton pump inhibitors was estimated in 2009. This is in line with the results of previous meta-analyses which yielded increased risk estimates and were subsequently reviewed by EMA (GIULIANIO, WILHELM and KALE-PRADHAN, 2012; JOHNSTONE, NERENBERG and LOEB, 2010; EUROPEAN MEDICINES AGENCY, 2012). However, EMA recommended that no risk minimization activities should be taken and kept this class under review. The authority considered that evidence from observational studies of an association between proton pump inhibitors as a class and pneumonia was inconsistent and might be subject to residual confounding (JICK and HERNANDEZ, 2011). Methodological differences between recent studies and those conducted years ago is one of the reasons that may delay the identification of an increased risk, as it was for VTE associated with oral contraceptives containing drospirenone. Differences between VTE definition, risk factors associated with patients and the type of contraceptives previously used in control groups were pointed out as the reasons why the first two studies published in 2007 reported a null association (LESTER et al., 2013). These methodological and clinical issues were taken into consideration in later studies reporting increased risks (LESTER et al., 2013). This may help to explain why only in 2011 an increased risk was pooled by cumulative meta-analysis, the same year that all regulatory authorities suggested labels' updates.

Taking into account the safety issues evaluated in this study and the correspondent regulatory decisions, it is not possible to draw definitive recommendations about the requirements of conducting meta-analyses every time safety signals are issued from data of longitudinal, comparative studies. Observational studies are more susceptible to bias and confounding and integrating data from such designs in meta-analyses may return results with marked heterogeneity across studies, as it was observed for most of the cases evaluated. A sensitivity analysis by study design was conducted to explore its effect as potential source of heterogeneity, but the results did not differ significantly, particularly in those meta-analyses integrating data exclusively from observational studies where higher values of between-

studies heterogeneity obtained in the primary analysis have persisted. When there is little heterogeneity of effects across studies, one may be willing to accept meta-analytic evidence as helping to establish a benefit/risk ratio (KIM and BERLIN, 2006; BERLIN, CEPEDA and KIM, 2012). In the presence of substantial heterogeneity, however, it is difficult to draw definitive conclusions and the acceptance of the results may take time. This might be one of the reasons why regulatory authorities can take several years to conclude on an increased risk in some cases addressed in this study.

This work is subject of some limitations. No systematic bibliographic search was conducted and cumulative meta-analyses were based exclusively on studies used to support safety alerts. Additionally, some of the data sources reviewed by regulatory authorities may not be published on their websites. Although Egger's asymmetry test and visual inspection of funnel plots may not indicate the presence of publication bias in most of the cases, such evaluation is difficult since no specific bibliographic searches were conducted.

The role of meta-analysis in pharmacovigilance is a matter of ongoing debate (DRUG INFORMATION ASSOCIATION, 2011). The Safety Planning, Evaluation and Reporting Team formed in 2006 recommends sponsors to develop a program safety analysis plan beginning with first clinical studies, as a tool to proactively plan for meta-analyses at regular intervals during marketed use of a product (CROWE *et al.*, 2009). The ICH E9 guideline also states that meta-analyses should be prospectively planned with the RCTs program in the development of a new treatment (INTERNATIONAL CONFERENCE ON HARMONISATION OF TECHNICAL REQUIREMENTS FOR REGISTRATION OF PHARMACEUTICALS FOR HUMAN USE, **1998**).

Council for International Organizations of Medical Sciences (CIOMS) Working Group X was established aiming at developing a consensus on scientific and methodological criteria that represents good practices when applied to meta-analyses of clinical data within the regulatory process (COUNCIL FOR INTERNATIONAL ORGANIZATIONS OF MEDICAL SCIENCES, 2013). These criteria are being developed to be used by both industry and regulators. The working group also intends to develop guidance on how to combine available information from both RCTs and observational studies to generate an integrated result, which is considered controversial. The results should be published in 2014.

The conclusions of the ongoing and further researches should be considered into guidelines where recommendations on how better to combine results from different studies designs in meta-analyses of AEs. Although there exist recommendations on how to conduct

systematic reviews and meta-analyses, none is dedicated to specifically guide researchers on how to integrate different data sources to better assess iatrogenics of interventions.

This work has a number of limitations. When evaluating the methodological differences between different study designs, it is important to consider any confounding factors that may account for any differences identified (GOLDER, LOKE and BLAND, 2011). The assessment of differences between study designs was not a primary aim of this work, but rather to evaluate the influence of different study designs in meta-analytic estimates.

Another limitation is the possibility of underrepresentation of the examples used to explore the initial investigational question. At the time of this researches were conducted, the safety of both GLP-1 receptor agonists and Xa coagulation factor direct inhibitors had been subject of investigation. Meta-analyses of AEs associated with drugs other than those evaluated in this thesis could have resulted in different conclusions.

All the meta-analyses conducted within this thesis have relied on data reported by investigators in the published studies. There was not any attempt to contact the researchers authoring the papers included in the meta-analyses since few hundreds of contacts would have to be established. This was a limitation of similar works (GOLDER, LOKE and BLAND, 2011).

There are a number of methodological considerations that need to be taken into account to design and conduct a meta-analysis. The uncertainty is higher when data from observational studies is integrated, in particular when combined with RCTs. This may be the principal reason for the slowing acceptance of meta-analysis as a tool in the medicines' benefit/risk ratio reevaluations following safety signals. Between-studies heterogeneity due to clinical and/or methodological differences may delay the conclusions of the decision-making process even when meta-analytic' pooled estimates found an increase in risk. There is a need to explore the between-studies heterogeneity from two perspectives, clinical and methodological. Clinical heterogeneity refers to differences associated with the participants, interventions or outcomes. The participants may differ for example in age or gender, the interventions may differ in type, dose and duration; and the definitions of the outcomes measured may differ, as well as the duration of follow-up. Methodological heterogeneity refers to differences in the way the studies were conducted, for example, differences in study design or risk of bias. Even though a review deliberately selects studies that may be

similar in many ways based on these factors, there can still be substantial differences that mean it might not make sense to pool their results.

The results of this work suggests that instead of restricting meta-analyses to one type of study design, a broad range of studies should be searched and considered for inclusion in the pooled estimates. Previous research recommends that systematic review of literature should not be restricted to specific study types and that both experimental and observational data should be included in meta-analyses of AEs of pharmacological interventions (GOLDER, LOKE and BLAND, 2011). Nonetheless, since the results of meta-analyses including different types of studies can be associated with higher uncertainty, further risk assessments based on the results from other data sources should be considered in the decision-making process.

# **CHAPTER VIII – FINAL CONCLUSIONS**

## **VIII. FINAL CONCLUSIONS**

## VIII.1. CONCLUSIONS

This thesis evaluated the potential usefulness of meta-analysis for Pharmacovigilance, exploring if this statistical technique would produce reliable estimates when combining results from different data sources, namely experimental and observational studies. In order to answer to the initial research questions, several studies were conducted. Briefly, the most relevant conclusions obtained throughout the work developed under this thesis are the following:

- The majority of meta-analyses published by the highly impact medical journals are designed to assess the efficacy of pharmacological interventions; only a limited number of meta-analyses are currently devoted to evaluate drug safety as a primary outcome. Randomized clinical trials are the main source of information from where data is pooled off; very few meta-analyses included data from both observational and experimental studies. Although meta-analyses including observational studies could be more frequently published in journals devoted to the pharmacoepidemiology and pharmacovigilance areas, the most read and quoted medical journals are those which will influence the clinical practice and prompt regulatory authorities to act.
- The results of meta-analyses of RCTs are less affected by between-studies heterogeneity, in particular when such trials have similar methodological design. The risk estimates for bleedings associated with Xa coagulation factor direct inhibitors, rivaroxaban and apixaban, were characterized by lower between-studies heterogeneity. The same was observed in the meta-analysis evaluating the risk of cancer associated with GLP-1 agonists, exenatide and liraglutide, although the rarity of this particular event have produced wider confidence intervals. In this particular case, the divergence between the risk of cancer associated with exenatide and liraglutide which was identified in the meta-analysis demonstrates that this technique may be useful in generating research hypothesis and, lately, safety signals.

- The inclusion of observational studies in meta-analysis, isolated or in combination with RCTs, leads to an increase in the between-studies heterogeneity. The risk estimates of such meta-analyses can produce statistical significant results, but should be interpret with caution due to the uncertainty produced by data pooled from different study designs. Pooled estimates showed no increased risk of acute pancreatitis associated with GLP-1 agonists. However, the inclusion of observational studies resulted in higher between-studies heterogeneity.
- Spontaneously reported suspected adverse drug reaction support most of the post-marketing benefit/risk ratio reevaluations conducted by regulatory authorities. It was identified that post-market safety regulatory decisions could be supported by meta-analyses' results, although less frequently. None regulatory decision used meta-analyses combining both experimental and observational studies as well as none authority used meta-analysis in exclusive when decided to act upon a safety issued.
- For safety alerts based on data from longitudinal, comparative studies, namely RCTs and observational studies (cohort and case-control), meta-analysis was able to produce risk estimates in line with authorities' conclusions in the majority of the situations. It was also demonstrated that cumulative meta-analysis was able to predict iatrogenic risks earlier than authorities' regulatory decisions. However, when there is a need to integrate data from both experimental and observational studies, results can be affected by excessive heterogeneity. This may delay regulatory authorities to accept the results of meta-analyses combining data from different study designs.

Although reliable risk estimates have shown to be produced from meta-analyses conducted to evaluate drug safety issues, between-studies heterogeneity may preclude investigators and regulatory authorities from draw robust conclusions from those results. Uncertainty may increase when observational data is pooled, in exclusive or in combination with experimental studies. The findings of this work do not let to recommend that a metaanalysis of the existing evidence should be conducted whenever a drug-safety alert is issued. Moreover, this technique does not replace further assessments when the benefit/risk ratio profile of a medicine needs to be revised due to an increased risk of a suspected ADR.
